Chapter 1 WellGate 5250 Introduction

System Description

WellGate 5250 is a cost effective solution for VoIP trunk gateway supporting one-, two-, or four-port T1/E1 VoIP trunks that provides voice and fax over IP network. It supports ITU-T H.323 V3, SIP RFC 2543/3261, SNMP V2, Call Detail Record, WEB management and other useful functions to meet customer requirements.

The built-in enhanced IVR (Interactive Voice Response) and Billing Service of WellGate 5250 is suitable for prepaid and postpaid service. It can rapidly provide value added service for customers.

WellGate 5250 V5.1 Features:

- Dual SIP/H.323 co-existing
- ITU-T H.323 v3 and H.450 compliance
- SIP RFC 2543/3261 standard compliance
- PSTN signaling: ISDN/PRI, CAS (MFC R2, MFC R1, E&M), **QSIQ**
- Mixed SIP, Gatekeeper and P2P calls
- Support H.323 Gatekeeper register, direct and route calls
- Support SIP outbound proxy, redirect and register server
- **Redundant SIP Proxy/Outbound Proxy Server Support (Outbond Active/Active fail over, Register A/A no fail over)**
- Support SIP Overload Redirect
- SIP supplemental service - on Hold, Call Transfer (Transferred)
- Built-in phone book and prefix routing for SIP and H.323 P2P calls
- Support H.323 fast connect, early H.245 and H.245 tunneling
- Support H.323 and SIP early media
- **VoIP to VoIP calls support – SIP to H.323, SIP to SIP, H.323 to H.323**
- **Global Trunk-Channel Block out: 0xffffffff (busy block out)**
- **Intelligent PSTN call routing and in-trunk hunting: reverse rotary, channel mask (default:0xffffffff), ANI prefix match**
- **Reset a channel/trunk on the fly**
- Flexible digit manipulation plan
- Support RADIUS Authentication, Authorization and Accounting
- Support access control by ANI, DNIS, IP, Gatekeeper only, proxy only or RADIUS
- SIP UDP/TCP support
- Behind NAT friendly for SIP calls
- Inbound and out of band DTMF transmission
- SIP/H.323 T.38 fax relay up to 14400 bps
- Dynamic call treatment based on DNIS, ANI or collected DTMF
- **Grouping DNIS/ANI Number Replacement**
- Built-in IVR & call-flow controller for PSTN / **VoIP side**
- CISCO compatible
- Web-based graphic announcement edit and management

- Multiple configuration saving
- Provides CDR (Call Detail Record)
- Built-in internal user authentication for prepaid & postpaid users

Technical Specification

Interface

- Two 10/100MB Ethernet Ports (Host & VoIP stream)
- Up to 4 T1/E1 (**120 Ohm-RJ48C connectors**)
75 Ohm needs external 3rd party BNC/RJ-48C adapter cables

Protocol and Standard

- ITUT H.323 v3 and H.450 compliance
- SIP RFC 2543/3261 compliance
- MGCP (**)

Audio Feature

- Codec -- G.711 A/μ-Law, G.723.1 (5.3K/6.3K), G.729A, G.729
- Support G.168 echo cancellation
- Configurable audio payload size & adaptive jitter buffer
- Support silent suppression for G.729A, G.723, G.729
- VAD (Voice Activity Detection)
- CNG (Comfort Noise Generation)

DTMF Transmission

- Transparent
- H.245 signal/alphabetic
- H.323 Q.931
- RFC 2833
- SIP INFO

FAX Support

- Automatic voice/fax detection
- T.38 fax relay based on H.323 Annex D
- SIP T.38 fax relay
- Up to G3 fax
- ECM support
- Redundant T.38 packet (0-2)
- CISCO compatible

Built-in IVR & call-flow controller

- Web-based GUI Drag and Drop interface
- Full control of call behavior (one-stage or two-stage dialing)
- IVR functions
- Support time duration play back (Chinese & English)
- Power call information branch
- Collected information validation
- Active disconnect & reconnect without hang up
- Selected disconnect cause code & behavior

Management Feature

- OS and program upgradeable
- Console port: RS-232 port
- TELNET

- Full Web management interface & real time monitor
- Front panel LCD
- SNMP v2 (H.341) and SNTP v4 support
- User account management
- Time zone and day light saving support
- Support fixed IP and DHCP
- Support DNS and dynamic DNS

LED indicators for system status

- Power/Storage access indicators
- Front panel LCD (2^{lines} X 16) status display

Power

- 90~240V auto switch

Environmental

- Operation temp: 0° C to 60° C
- Relative humidity: 5% to 95%

Dimension

- 483mm(L) x 450 mm(W) x 44mm(H)

Certification

- CE

Wellgate 5250 V5.1 Detail Spec.

Feature		Wellgate 5250 V5.1
Physical Dimension		
1	Width	483mm
2	Height	44mm
3	Depth	450mm
4	Industrial rack mount	Yes
5	Color	Black
6	Weight	8Kg
Power / Environmental		
1	Power	90-240V auto switch
2	Operating temperature	0~60 C
3	Relative humidity	5%~95%
Processors & Storage		
1	DSP vendor	Intel Pentium, AudioCodes DSP
2	Operation System	XP Embedded
3	RAM	512 MB
4	Program/Data Storage	256 MB DOM
5	OS Upgradeable	Yes
7	Program Upgradeable	Yes
Front Panel Display		
1	LED status	Power/DOM/System
2	LCD status	Yes
LAN Interface		
1	10/100 Base Ethernet	10/100MB Ethernet ports *2 (host & RTP)
2	IP Address Required	2
PSTN Interface		
1	Customizable E1/T1 CAS	Yes
2	E1 CAS DTMF	Loop Start FXO Hot-Line
3	E1 CAS R2 MF	Argentina, Bolivia, Brazil, Chile, China, Czech-Republic, Egypt, India, Indonesia, Israel, ITU, Korea, Malaysia, Mexico, Philippines, Thailand, Uruguay, Venezuela, RomTelcom
4	E1 ISDN PRI Support	Euro, Australia, Hong Kong, Korea, New Zealand, QSIC
5	E1/T1 Interface	Selectable
6	PCM law Support	Alaw/Mulaw selectable

7	T1 CAS DTMF/R1MF	E&M Bell Core Feature Group D, Wink Start, E&M Delay Start, E&M Feature Group A Immediate Start, E&M Feature Group B Wink Start, E&M Feature Group D Wink Start(ANI B4 ADDR), E&M Feature Group D Wink Start, E&M Immediate Start, E&M Wink Start, GroundStart FXO, GroundStart FXS, Loop Start FXO, Loop Start FXS, Loop Start FXO Hot-Line
8	T1 ISDN PRI Support	NI2 ISDN, 5ESS 10 ISDN, DMS100 ISDN, NTT ISDN (INS-1500), Hong Kong, QSIC
9	Trunk Spans	1, 2, 4 (T1/E1s) per chassis
10	Default Trunk Channel Mask	Yes
11	PSTN Line Hunting	Yes
12	PSTN Line Hunting Channel Selection	Yes
13	On the Fly Reset Channel/Trunk	Yes
Audio Codec Support		
1	G.711 A-law	Yes
2	G.711 u-law	Yes
3	G.723.1	Yes (5.3/6.3K)
4	G.729A	Yes
5	Selectable Payload Size - G.711	20, 40, 60 ms
6	Selectable Payload Size - G.723	30, 60, 90 ms
7	Selectable Payload Size - G.729	20, 40, 60 ms
Fax Transmission		
1	Bypass mode	Yes
2	CISCO Compatible	Yes
3	ECM Support	Yes
4	FAX auto-detection	Yes
5	H.323 Annex D Support	Yes
6	SIP- T.38 Reinvite	Yes
7	T.38 During fast connect	Yes
8	T.38 Redundant Packet	0-2
9	Transparent mode	Yes
10	Up to G3 FAX	Yes (up to 14400 bps)
DTMF Transmission		
1	RFC 2833	Yes
2	H.245 Alphanumeric mode	Yes
3	H.245 Signal mode	Yes
4	Q.931 UUI	Yes
5	SIP INFO	Yes
6	Transparent mode	Yes
Voice Quality & Echo Cancellation		
1	Adaptive Jitter Buffer	Yes
2	CNG	Yes

3	G.168 (Echo Cancellation)	Yes (32ms)
4	Gain Control	Yes
5	Improved Echo Tail Suppression	Yes
6	Silence Suppression	Yes
7	VAD	Yes
Maintenance		
1	Administrative Log	Yes
2	Auto Daylight Saving	Yes
3	Customizable Time Zone	Yes
4	Front Panel LCD Setup	Yes
5	FTP Server	Yes
6	HTTP server	Yes
7	HTTP SSL support	Yes
8	Multiple configuration	Yes
9	NTP time synchronization	Yes (SNTP V4)
10	Password Security	Yes
11	RS232	Yes
12	System Event Log	Yes
13	Telnet	Yes
14	Time Zone Support	Yes
15	User Account Manager	Yes
16	Web-based GUI	Yes
17	Web-based Real Time Monitor	Yes
18	Web-based Voice File Management	Yes
Network Management		
1	DHCP	Yes
2	Fixed IP	Yes
3	DNS	Yes
4	Dynamic DNS	Yes
5	Ping	Yes
6	TOS field setting	Yes (RTP only)
7	SNMP V2 MIB I & II	Yes
8	SNMP get command	Yes
9	SNMP set command	Yes
10	SNMP Trap	Yes
11	H.341 MIB Support	Yes
12	SysLog Support	Yes
H.323 Protocol Support		
1	H.323 V3	Yes
2	H.323 ID	Yes
3	E.164 ID	Yes
4	Fast Connect	Yes (selectable for incoming/outgoing)
5	H.450	Yes
6	H.245 Tunneling	Yes
7	Early H.245	Yes
8	Cause Code Mapping	Yes

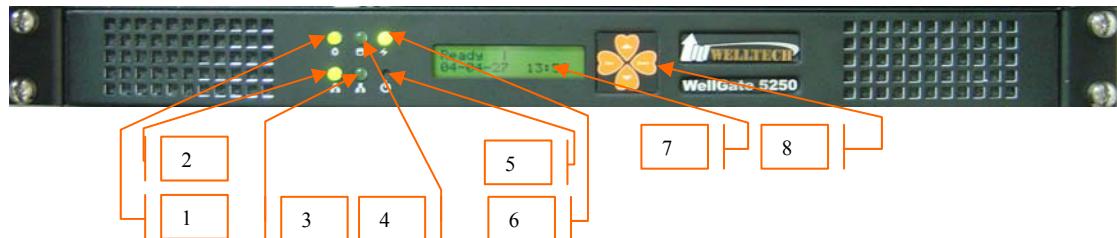

SIP Protocol Support		
1	Cause Code Mapping	Yes
2	HTTP Digest Authentication	Yes
3	SIP Call on Hold	Yes
4	SIP Early Media	Yes
5	SIP Overload Redirect	Yes
6	SIP Transfer (unattend)	Yes
7	SIP Transfer (attend)	Yes
8	SIP/TCP	Yes
9	SIP/UDP	Yes
10	SIP-180/SDP	Yes
11	SIP-183/SDP	Yes
12	SIP-PRACK	Yes
13	SIP-RFC 3261	Yes
14	SIP-RFC 3264 (Offer/Answer)	Yes
H.323 Gatekeeper Support		
1	Gatekeeper Register	Yes
2	Direct call	Yes
3	Routed call	Yes
4	Light weight RRQ	Yes
5	IRQ: IRR sequence	Yes
6	Gatekeeper Call only	Yes
SIP Proxy Sever Support		
1	SIP Outbound Proxy Support	Yes
2	SIP Redirect Server Support	Yes
3	SIP Registar Server Support	Yes
4	Redundant SIP Proxy Server	Yes
5	Auto Fail Over	Yes
Dial Plan		
1	P2P H.323/SIP Call	Yes
2	GK Call	Yes
3	SIP Call	Yes
4	PSTN Call	Yes
5	Mixed SIP, P2P, GK call	Yes
6	Build-in Phone Book	Yes
7	P2P Prefix Routing	Yes
8	Digits Manipulation	Yes
9	ISDN Dial Plan by Prefix	Yes (Source & Destination)
Call Type Support		
1	Call Decision	Dynamic Decided by Call Flow
2	H.323 to H.323 Call	Yes
3	H.323 to H.323 Fax Realy	Yes
4	H.323 to PSTN Call	Yes
5	H.323 to SIP Call	Yes
6	H.323 to SIP FAX Relay	Yes

7	H.323 to SIP FAX Relay	Yes
7	PSTN to H.323 Call	Yes
8	PSTN to PSTN Call	Yes
9	PSTN to SIP Call	Yes
10	SIP to H.323 Call	Yes
11	SIP to PSTN Call	Yes
12	SIP to SIP Call	Yes
13	SIP to SIP Fax Relay	Yes
14	VoIP to VoIP RTP unRouted	Yes
15	VoIP to VoIP RTP Routed	Yes
Enhance Service		
1	ANI Access List	Yes
2	DNIS Access List	Yes
3	DID/DOD	Yes
4	PSTN Two Stage Dialing	Yes
5	VoIP Two Stage Dialing	Yes
6	Intelligent PSTN Call Routing	Yes (Random, Round Robin, Priority)
7	In-trunk hunting method	cyclic, random, rotary, reverse cyclic, reverse rotary
8	Ring Back Tone Generation	Yes (per trunk enable/disable)
9	Call Progress Tone Support	Yes
10	Web-based Call Flow GUI	Drag and Drop interface, Full control of call behavior (one-stage or two-stage dialing), IVR functions, Support time duration play back (Chinese & English), Power call information branch, Collected information validation, Active disconnect & reconnect without hang up, Selected disconnect cause code & behavior
11	Play Credit Time Duration	Yes (Chinese & English)
12	Play Credit Balance	Yes (Chinese & English)
13	Almost-time-expired notify tone	Yes
14	IVR for PSTN	Yes
15	IVR for SIP	Yes
16	IVR for H.323	Yes
17	IP Access List	Yes
18	ANI Replacement	Yes
19	DNSI Replacement	Yes
AAA		
1	Call detail record (CDR)	Yes
2	RADIUS Authentication	Yes
2	RADIUS Authorization	Yes
3	RADIUS Accounting	Yes
4	Redundant RADIUS Server Support	Yes, Active/Standby/Auto Failover
5	PSTN Prepaid Support	Yes

6	VoIP Prepaid Support	Yes
Embedded AAA		
1	Embedded Prepaid Service	Yes
2	Embedded Postpaid Service	Yes
3	Point/second Calculation	Yes
4	Second/point calculation	Yes
5	Auto Disable/Clean User	Yes
6	PSTN Prepaid Support	Yes
7	VoIP Prepaid Support	Yes
System Limitation		
1	Max DM	4096
2	Max IP ACL	2048
3	Max DNIS ACL	4096
4	Max ANI ACL	4096
5	Max User ACL	20000
6	Max Phone Book Entries	10000
7	Max Call Flow Component	256
8	Max CDR Keep Days	5
9	Max Voice File Storage	10 hours
Manual		
1	English User Guide	Yes

WellGate 5250 Appearance Description

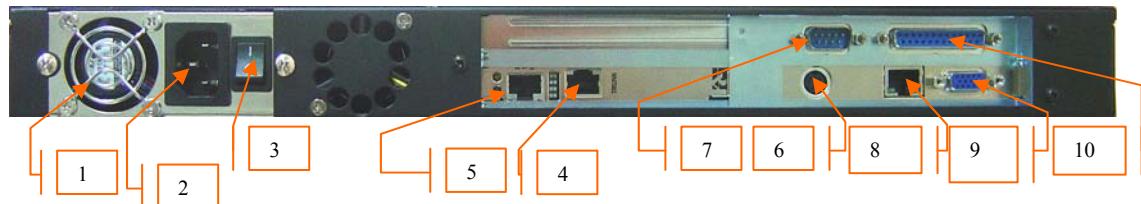

WellGate 5250 Front Panel:

Functions:

- 1: Power LED
- 2: Network1 Interface LED
- 3: Network2 Interface LED (not used)
- 4: H/D LCD
- 5: Power Switch
- 6: System Status LED
- 7: LCD Panel
- 8: LCD Touch Panel

WellGate 5250 Rear Panel:

Functions:

- 1: Electric Fan
- 2: AC Power outlet
- 3: AC Power switch (**Keep on**)
- 4: Trunk E1/T1 port
- 5: VoIP Ethernet port
- 6: Keyboard/Mouse
- 7: Com1 port
- 8: Ethernet port
- 9: VGA
- 10: print port (not available)

Chapter 2 Logon WellGate 5250

After connected E1/T1 & Ethernet cables into the WellGate 5250, turned on the power. The first step is to logon the system and set up the IP address.

Before you can use the Browser to config WellGate 5250, you need to have Java Standard Runtime (1_4_1_02) to make it work. Please refer to [Appendix 2 Java plug-in Install](#) for detail.

Logon WellGate 5250

Step1: Start IE5.0 (or later version) to navigate WellGate 5250 Management System by typing the default IP address (the default URL is <http://192.168.111.111:10087>). The screen will display **User ID** and **Password** as figure 2.1-1.

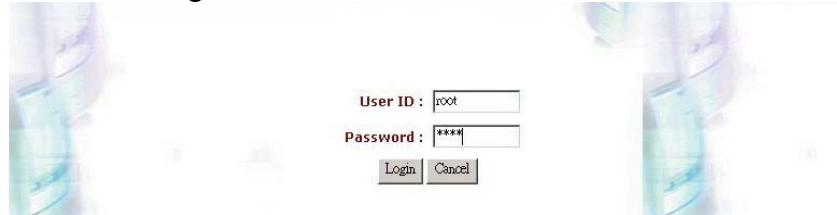

Figure 2.1-1

Note: The default network IP address is 192.168.111.111 and subnet mask is 255.255.0.0

Step 2: Enter log user name and password (the default user id is root and user password is root). You can manage your user account via web (refer to Section “[Account Manager](#)”) later.

Figure 2.1-2

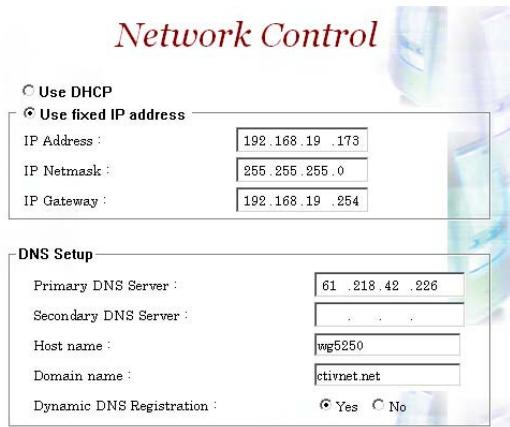

Step 3: The screen shows the Home Page of WellGate 5250 as figure 2.1-3.

Figure 2.1-3

Network Configuration

Step 1: After successfully logon to the system, we need to change the network configuration. Click **Control→Network** to setup the network parameters as figure 2.2-1.

The screenshot shows the 'Network Control' configuration page. It includes sections for 'IP Address' (192.168.19.173), 'Netmask' (255.255.255.0), and 'Gateway' (192.168.19.254). Below this is a 'DNS Setup' section with fields for 'Primary DNS Server' (61.218.42.226), 'Secondary DNS Server' (empty), 'Host name' (wg5250), 'Domain name' (ctivnet.net), and 'Dynamic DNS Registration' (Yes selected).

Figure 2.2-1

Step 2: Enter the deserved IP address, Submask and default gateway. Apply the change by clicking **apply** button as figure 2.2-2.

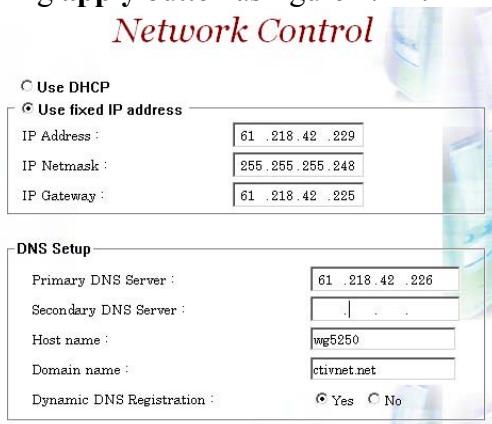

Figure 2.2-2

Step 3: When screen shows “**Setup network configuration successfully!**” It means the IP Network setting is successfully changed as figure 2.2-3.

Figure 2.2-3

• **Note:** “*Network Control*” takes around 5-second to apply the new network configuration. Please logon again with new IP address after 5 seconds.

System Time Configuration

Step 1: When relogon to the new IP address; the next is to setup the system time zone. Click **Control→System Time Zone** to setup the system as figure 2.3-1.

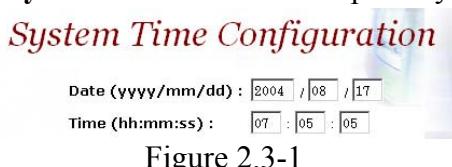

Figure 2.3-1

Step 2: After apply the new time zone, click **Back** to adjust the date and time as figure 2.3-2.

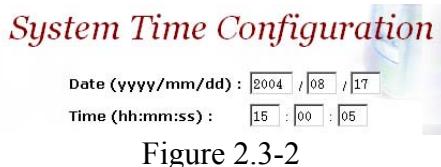

Figure 2.3-2

Step 3: Enter current date and time. Apply the change by clicking **Apply** button as figure 2.3-3.

Date (yyyy/mm/dd) :
 Time (hh:mm:ss) :

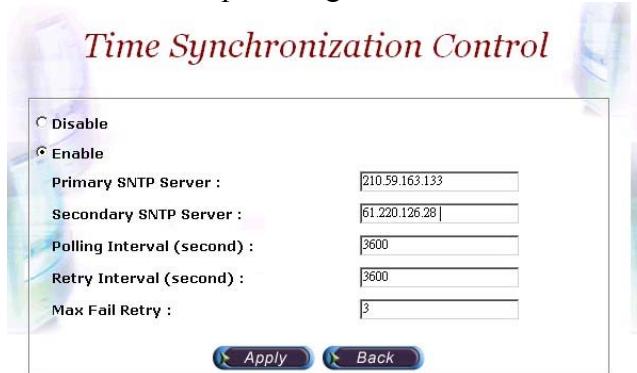

Figure 2.3-3

Step 4: The screen will shows “**Setup system time successfully!**” It means the **System Time** setting is successfully changed as figure 2.3-4.

Figure 2.3-4

Step 5: If you would like to use SNTP to sync time with a SNTP V4 Server, click **Time Sync** button to setup it as figure 2.3-5.

Disable
 Enable
 Primary SNTP Server :
 Secondary SNTP Server :
 Polling Interval (second) :
 Retry Interval (second) :
 Max Fail Retry :

Apply **Back**

Figure 2.3-5

Account Manager

Step 1: You can manage your user account by click **Control→Account Manager**.

Add a new user account, Click **New** button as figure 2.4-1.

User ID	Password
admin	*****
root	*****

Figure 2.4-1

Step 2: Enter the new user ID, password, user role and description, as you need.

Apply the change as figure 2.4-2.

User ID :
 Password :
 Confirm Password :

Apply **Back**

Figure 2.4-2

Field Description:

- User ID: Login User ID
- Password: Login Password
- Confirm Password: Confirm new password again

Step 3: When screen shows “***Create user account successfully!***” It means user account setting is successfully created as figure 2.4-3

Figure 2.4-3

☻ Note: The system provides 2 USER ID by default:

User 1: “root” Password: “root”

User 2: “admin” Password: “admin”

Relogin

Step 1: Click Control→Relogin to relogin by another user account as figure 2.5-1.

Figure 2.5-1

Step 2: Enter new User ID and Password to relogin the WellGate 5250 as figure 2.5-2.

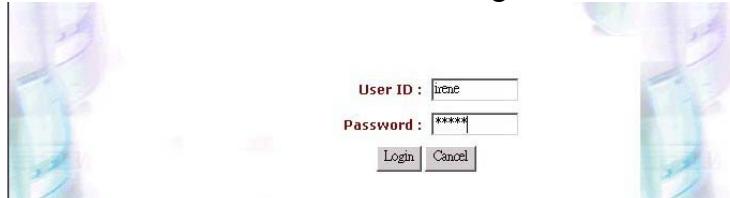

Figure 2.5-2

Step 3: The screen shows the Home Page of WellGate 5250 as figure 2.5-3.

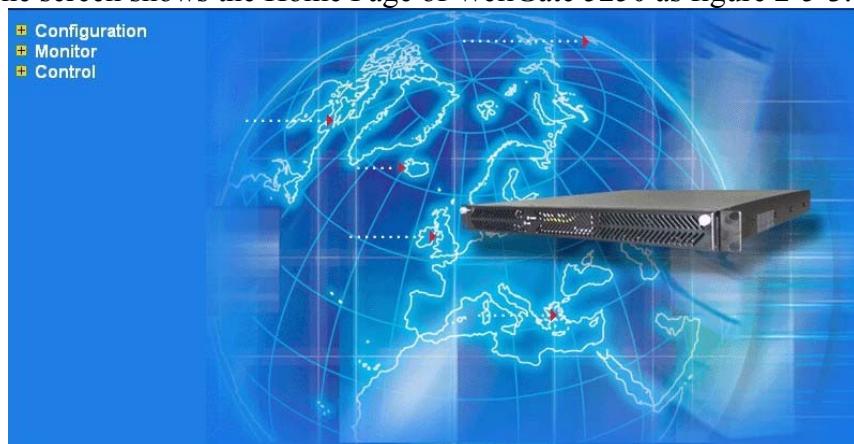

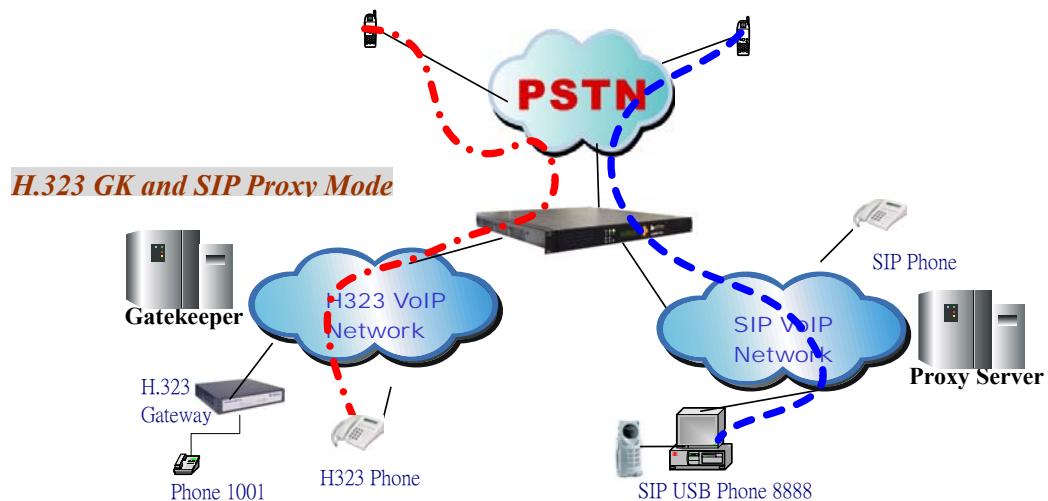

Figure 2.5-3

Chapter 3 H.323 Gatekeeper and SIP Proxy Mode Configuration

Environment used in this chapter

Process:

PSTN → H.323 Call: DNIS (1001) → Make H.323 - Gatekeeper Call (1001)
 → SIP Call: DNIS (8888) → Make SIP – SIP Proxy Call (8888)

H.323 → DNIS (5932111222) → DM (H.323_in_drop) → Make Call
 (0932111222)
 SIP → DNIS (11382265699) → DM (SIP_in_drop) → Make Call
 (82265699)

Interface Configuration

This section is going to setup the VoIP interface.

Step 1: Now we are going to setup the VoIP interface, click **Configuration→Interface** to setup VoIP T1/E1 interface as figure 3.1-1.

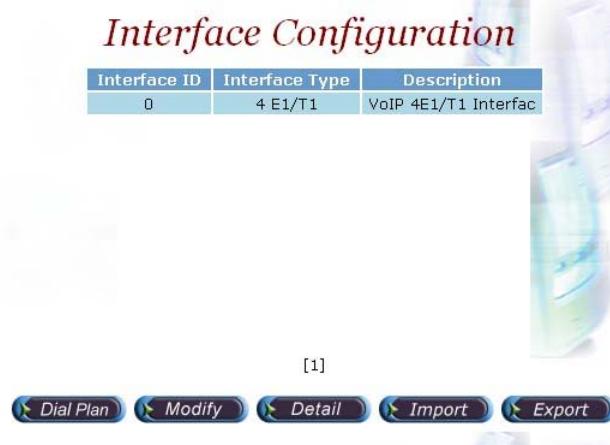

Figure 3.1-1

Step 2: Double-click the installed interface (i.e Interface ID:0) to config it as figure 3.1-2.

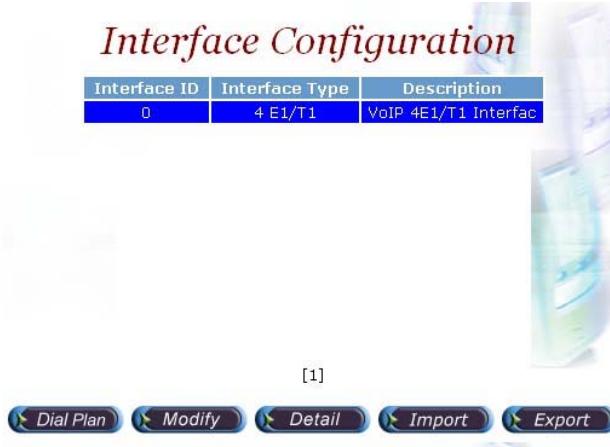

Figure 3.1-2

Step 3: Modify the VoIP Interface parameters (i.e. IP Address, Protocol Tag, Subnet Mask and Default gateway) and apply the change by clicking **Apply** as figure 3.1-3.

Interface ID :	0	Card Slot :	3
Interface Type :	4 E1/T1		
Description :	VoIP 4 E1/T1 Interface 1		
Serial No :	242807		
License Key :	020519d73e655d430901e35ef2dd1497		
IP Address :	192.168.19.174		
Subnet Mask :	255.255.255.0		
Default Gateway :	192.168.19.254		
PCM Type :	A-law		

[Apply](#) [Cancel](#) [Back](#) [Advance](#) [Detail](#)

Figure 3.1-3

Frequency changed parameters: (Refer to section “[Interface Configuration](#)” for more detail)

- IP Address: 192.168.19.174
- Subnet Mask: 255.255.255.0
- Default Gateway: 192.168.19.254
- PCM Type: A-law or Mulaw

☻ **Caution:** Subnet Mask does not support Supernet.

Step 4: After successfully to change the Interface configuration, the screen come back the page of **Interface Configuration** as figure 3.1-4.

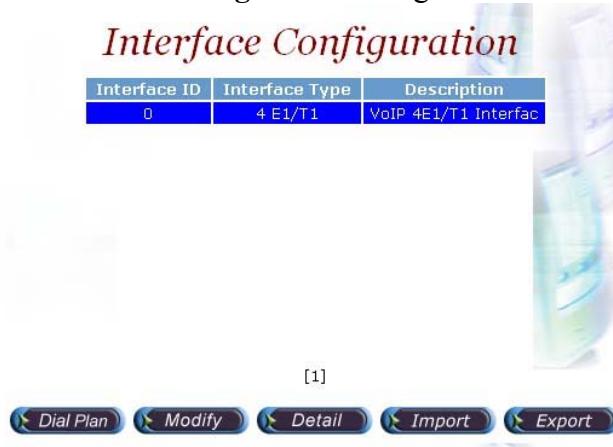

Figure 3.1-4

T1/E1 Trunk Configuration

This section is going to setup the PSTN trunk parameters.

Step 1: Select the installed interface to modify the trunk parameter by click **Detail** button as figure 3.2-1.

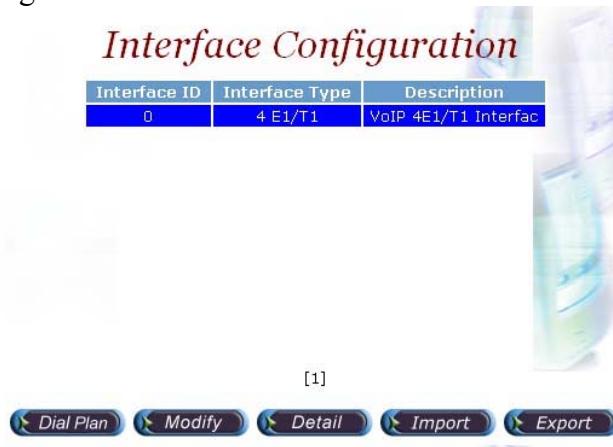

Figure 3.2-1

Step 2: Select the trunk to be modified, and click **Modify** button as figure 3.2-2.

Figure 3.2-2

Step 3: Modify the trunk parameters (i.e. Trunk Type, Termin Side, Trunk Mode, Protocol Tag, Line Code) and apply the change by clicking **Apply** as figure 3.2-3.

Trunk Configuration

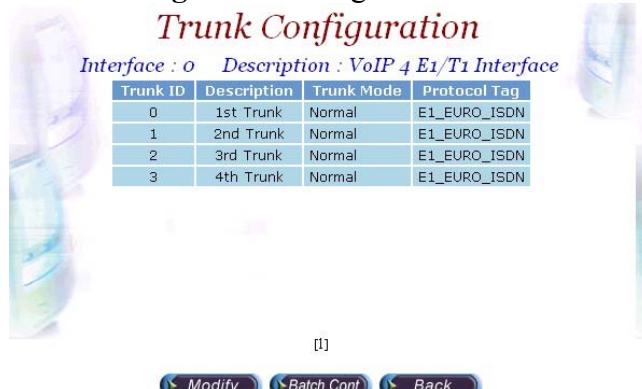

Interface ID :	0
Trunk ID :	0
Trunk Type :	<input type="radio"/> T1 <input checked="" type="radio"/> E1
Description :	1st Trunk
Termin Side :	User Side
Trunk Mode :	Normal
Hunting Method :	rotary
Protocol Tag :	E1 EURO ISDN
CAS Variance :	
Framing Method :	automatic CRC4 or Double Frame selection
Line Code :	HDB3
PSTN Trace :	No Trace
Inbound DM Group :	None
Outbound DM Group :	None
Local Ring Back :	<input type="radio"/> Yes <input checked="" type="radio"/> No
Channel Mask :	0xffffffff
Clock Master :	<input type="radio"/> On <input checked="" type="radio"/> Off

Figure 3.2-3

Frequency Changed Parameters:

- Trunk Type: E1 or T1
- Termin Type: User Side or Network Side
- Trunk Mode: Normal
- Protocol Tag: ISDN protocol used
- Line Code: T1 or E1 line code used

Step 4: After successed to change the Trunk Configuration, the screen comes back the page of **Trunk Configuration** as figure 3.2-4.

The screenshot shows a table titled "Trunk Configuration" with the following data:

Trunk ID	Description	Trunk Mode	Protocol Tag
0	1st Trunk	Normal	E1_EURO_ISDN
1	2nd Trunk	Normal	E1_EURO_ISDN
2	3rd Trunk	Normal	E1_EURO_ISDN
3	4th Trunk	Normal	E1_EURO_ISDN

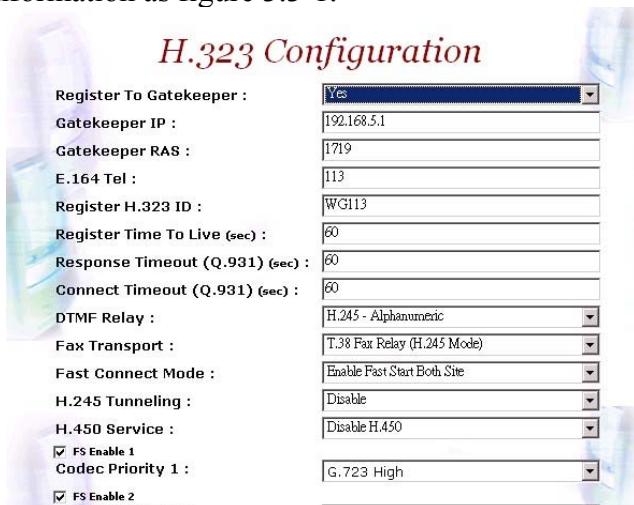

Buttons at the bottom include "Modify", "Batch Cont.", and "Back".

Figure 3.2-4

H.323 Configuration

This section is going setup the H.323 parameter. If you only need SIP calls, you can skip it.

Step 1: Click Configuration→H.323 to setup the H.323 parameters for Gatekeeper related information as figure 3.3-1.

The screenshot shows the "H.323 Configuration" page with the following settings:

- Register To Gatekeeper : Yes
- Gatekeeper IP : 192.168.5.1
- Gatekeeper RAS : 1719
- E.164 Tel : 113
- Register H.323 ID : WGI13
- Register Time To Live (sec) : 60
- Response Timeout (Q.931) (sec) : 60
- Connect Timeout (Q.931) (sec) : 60
- DTMF Relay : H.245 - Alphanumeric
- Fax Transport : T.38 Fax Relay (H.245 Mode)
- Fast Connect Mode : Enable Fast Start Both Site
- H.245 Tunneling : Disable
- H.450 Service : Disable H.450
- FS Enable 1
- Codec Priority 1 : G.723 High
- FS Enable 2
- Codec Priority 2 : G.729

Figure 3.3-1

Frequency used parameters:

- Register to Gatekeeper: Yes
- Gatekeeper IP: 192.168.5.1
- E.164 Tel: 113
- Register H.323 ID: 113

Step 3: You can see the screen display the new configuration of the **H.323 Configuration** as figure 3.3-3.

Figure 3.3-3

SIP Configuration

This section is going setup the SIP parameter. If you only need H.323 calls, you can skip it.

Step 1: Click **Configuration→SIP** to setup the SIP parameters for SIP Proxy Server related information as figure 3.4-1.

Primary SIP Register :	<input checked="" type="radio"/> Yes <input type="radio"/> No
Primary Registrar Server :	192.168.19.150
Primary Registrar Port :	5060
Primary Registrar User :	173
Primary Registrar Password :	***
Primary Registrar TTL :	120
Secondary SIP Register :	<input checked="" type="radio"/> Yes <input type="radio"/> No
Secondary Registrar Server :	192.168.19.157
Secondary Registrar Port :	5060
Secondary Registrar User :	173
Secondary Registrar Password :	***
Secondary Registrar TTL :	120
Primary Outbound Proxy Server :	192.168.19.150
Primary Outbound Proxy Port :	5060
Primary Outbound Proxy User :	173
Primary Outbound Proxy Password :	***
Secondary Outbound Proxy Server :	192.168.19.157
Secondary Outbound Proxy Port :	5060
Secondary Outbound Proxy User :	173
Secondary Outbound Proxy Password :	
Codec Selection Policy :	Local SDP Order

Figure 3.4-1

Frequency used parameters:

- SIP Register: Yes
- Primary Registrar Server: 192.168.19.150
- Primary Registrar Port: 5060
- Primary Registrar User: 173
- Primary Registrar Password: 173
- Primary Outbound Proxy Server: 192.168.19.150

- Primary Outbound Proxy Port: 5060
- Primary Outbound Proxy User: 173
- Primary Outbound Password: 173

Step 3: You can see the screen display the new configuration of the **SIP Configuration** as figure 3.4-2.

Setting	Value
Primary SIP Register :	Yes
Primary Registrar Server :	192.168.19.150
Primary Registrar Port :	5060
Primary Registrar User :	173
Primary Registrar Password :	*****
Primary Registrar TTL :	120
Secondary SIP Register :	Yes
Secondary Registrar Server :	192.168.19.157
Secondary Registrar Port :	5060
Secondary Registrar User :	173
Secondary Registrar Password :	*****
Secondary Registrar TTL :	120
Primary Outbound Proxy Server :	192.168.19.150
Primary Outbound Proxy Port :	5060
Primary Outbound Proxy User :	173
Primary Outbound Proxy Password :	*****
Secondary Outbound Proxy Server :	192.168.19.157
Secondary Outbound Proxy Port :	5060
Secondary Outbound Proxy User :	173
Secondary Outbound Proxy Password :	*****

Figure 3.4-2

Digit Manipulation

The purpose of “Digit Manipulation” is to add or drop dialed digits for PSTN or IP side (Interface configuration for PSTN side & H.323 Configuration for IP side) at the selected interface in order to meet local PSTN dialing requirement. It can also be used in **Call Flow Edit** for flexible usage.

Step 1: We introduced the group and interface dependent digital manipulation to meet the customer’s requires. Click **Digit Manipulation** to add a new Digit Manipulation Group, add as figure 3.5-1.

Group ID	Description

Page 1

Figure 3.5-1

Step 2: Enter the related parameters and click **Apply** button as figure 3.5-2.

Figure 3.5-2

Field Description:

- Group ID: 0 (DM Group identify)
- Description: H.323; H323 In Drop
SIP: SIP In Drop

Step 3: Click the New created DM and **Detail** button to add digits setting as figure 3.5-3.

Figure 3.5-3

Step 4: Click **New** button to add a new DM rule as figure 3.5-4.

Figure 3.5-4

Step 5: Create a new H.323 DM Group “1” and DM detail is show as follows:

Digit Manipulation List			
Matched Pattern	Group Id	Drop	Insert
5	1 - H.323 In Drop	5	
504	1 - H.323 In Drop	5	

[I]

   

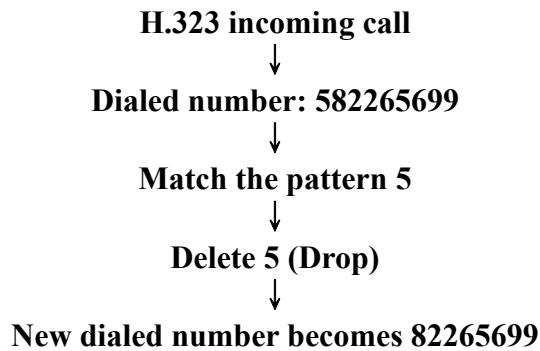

Figure 3.5-5

H.323 Incoming Call DM Setting:

- Matched Pattern: 5 (pattern to be matched)
- Group ID: 1-H323 In Drop (belong to this DM group)
- Drop: 5 (drop digits)

Step 5: Also create a new SIP DM Group ‘2’ and DM detail is show as follows:

Digit Manipulation List			
Matched Pattern	Group Id	Drop	Insert
113	2 - SIP In Drop	113	
11307	2 - SIP In Drop	113	

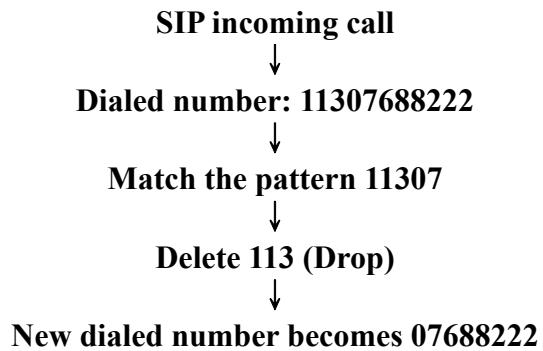

[I]

Figure 3.5-6

SIP Incoming Call DM Setting:

- Matched Pattern: 113 (pattern to be matched)
- Group ID: 1-SIP In Drop (belong to this DM group)
- Drop: 113 (drop digits)

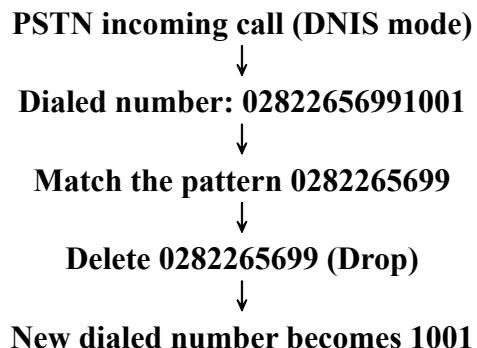

Step 6: Create a PSTN incoming call DM Group “3” and DM detail is show as follows:

Figure 3.5-7

PSTN DM Setting:

- Matched Pattern: 0282265699 (pattern to be matched)
- Group ID: PSTN In Drop (belong to this group id)
- Drop: 0282265699 (drop digits)

Note: *Digit Manipulation have to tapped for PSTN Side (Trunk→Outbound/Inbound DM Group), VoIP Side (VoIP→Outbound/Inbound DM Group) or Call Flow (refer to section “[Call Flow Editor](#)”) to take effect.*

Chapter 4 Call Flow Editor

Call Flow Editor is used to control the call behavior including voice prompt, AAA, DM...etc. It requires Java run time to run.

Step 1: Click Control→Call Flow Editor to create a Call Flow, click  button to activate IVR Tool as figure 4-1

Figure 4-1

Component Description:

-  New: Create a new call flow
-  Load Call Flow: Load call flow from WellGate 5250
-  Save: Save a call flow in WellGate 5250
-  Cut: Cut a component
-  Copy: Copy a component
-  Paste: Paste a component
-  Delete: Delete a component
-  Line: Connecting 2 components together
-  Select: Select the component at call flow workspace
-  Scroll: Scroll the call flow workspace
-  Zoom: Zoom in or zoom out the workspace
-  View Grid: View or not
-  Show Component Table: Show all component table

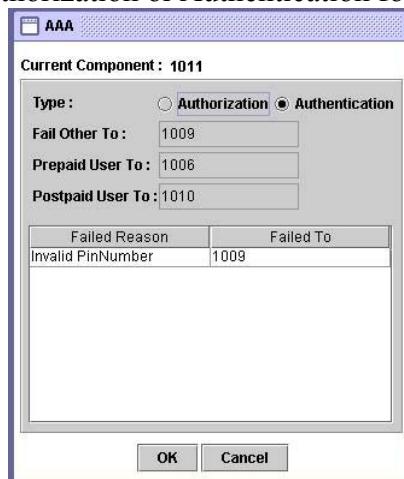

Step 2: Drag and drop the required component icon into the workspace as figure 4-2.

Figure 4-2

Right click the component to bring up the component property to setup parameter:

-  AAA: Send Authorization or Authentication for validation

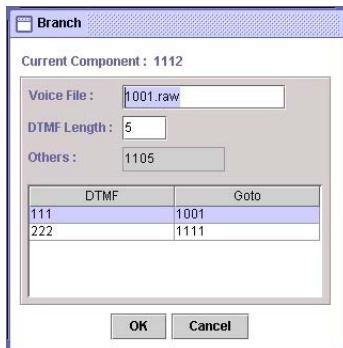

- Type: AAA type selection
 - Authorization: Send RADIUS Authorization packet out
 - Authentication: Send RADIUS Authentication packet out
- Success To: Success to component
- Failed other to: Failed to component
- Failed Reason: Return code from RADIUS server
- **Line Property:**
 - Invalid Account
 - Account In Use

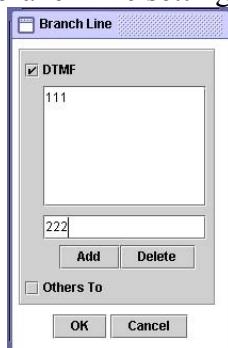

- Zero Balance
- Account Expired
- Over Credit Limit
- Number of Retries Exceeded
- Insufficient Balance

©Note: Detail response attributes, please refer [RADIUS Format Attributes](#)

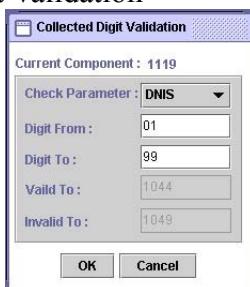

-  Answer: Answer incoming call (PSTN only)
-  Branch: Play an announcement and branch into different route

- Voice File: Voice prompt file (“. raw” format) to be playing
- DTMF Length: Number of DTMF to be receiving
- Others: Default flow if not match
- DTMF: DTMF match pattern
- Goto: The next component if matched
- Line Propriety:
-Branch Line: DTMF branch line setting

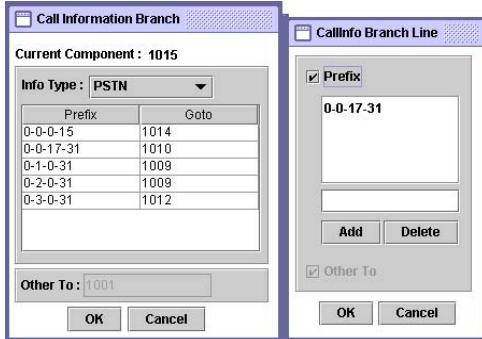

-  CDV: Collected Digit Validation

- Check Parameter: Check parameter type (DNIS, ANI....)
- Digit From: Start digit from

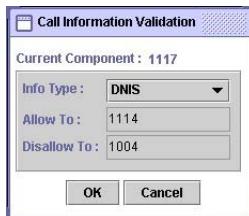

- Digit To: End digit to
- Valid To: If the checked variable is success to validate
- Invaried To: If the checked variable is not success to validate

-  CIB: Call Information Branch

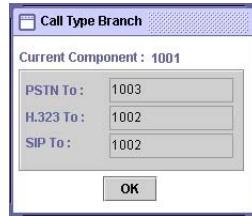

- Info Type: Information type selection
 - ANI: Calling Number
 - DNIS: Called Number
 - IP: IP Address or network (e.g. 192.168.0.0)
 - PSTN: E1/T1 trunk and channel filter, format: **interface id- trunk id- trunk start- trunk stop**
 - Prefix: The prefix to be match
- 0-1-17-31:
 - 0: Interface ID (Always 0)
 - 1: Trunk ID: 1
 - 17: Start from B Channel 17
 - 31: Stop from B Channel 31
- Goto: The component to run next
- Call Info Branch Line: ANI, DNIS, IP or PSTN goto setting

-  CIV: Call Information Validation, the user need setup the ACL for DNIS and IP TO take effect

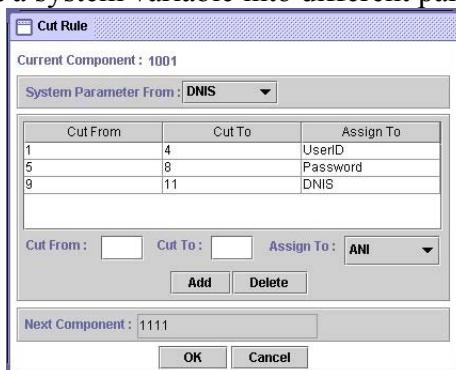

- Info Type: The info type to be validation
 - DNIS: Called number
 - ANI: Calling number
 - IP: In coming IP address
 - User: User ID
- Allow To: If it is met the ACL defined
- Disallow To: If it is not met the ACL defined

-  CTB: Call Type Branch

- PSTN To: Route for PSTN call
- H.323 To: Route for H.323 call
- SIP To: Route for SIP call

-  Cut Rule: Cut a system variable into different parts

- Cut From: Cut start digit from (start from 1)
- Cut To: Cut end digit to
- Assign To: Store the cutted result into

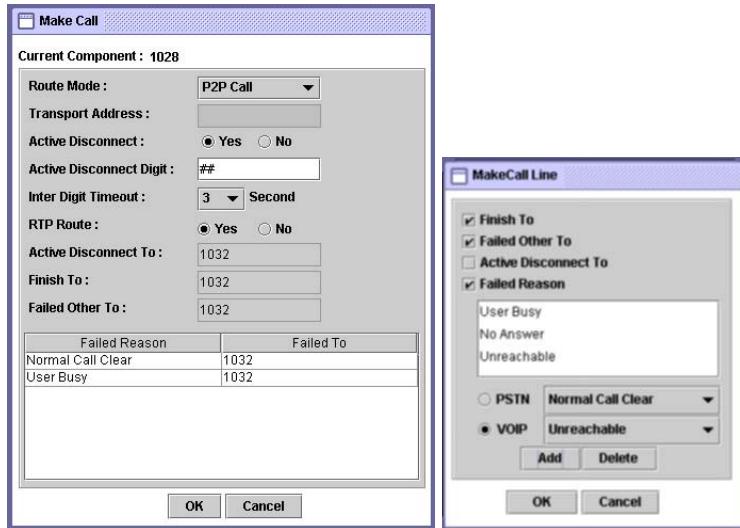

-  Disconnect: Disconnect the call

-  DM: Digit Manipulation

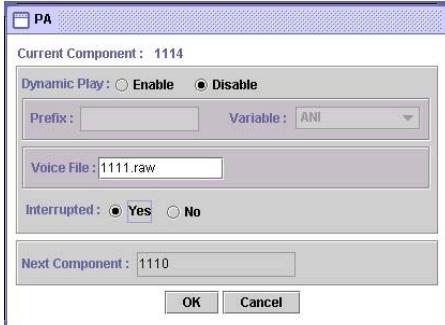

- DM Parameter: Manipulation ANI or DNIS
- DM Group ID: Apply to DM group

-  MakeCall: Make Call to PSTN or H.323/SIP site

- Route Mode: Gatekeeper Call or P2P Call or PSTN...etc. (for PSTN incoming call, please select the Gatekeeper, P2P Call, or SIP Proxy call TA; for H.323/SIP incoming call, please select the PSTN call)
- Transport Address: When used for “H.323 TA” routing mode, the format used is “Ipaddr:port” (e.g. 192.168.111.50:1720)
- Active Disconnect: Enable PSTN user can actively disconnect the call or not
- Active Disconnect Digit: The DTMF digit to be tread as the disconnect trigger. Only can be used “Active Disconnect” enable
- Active Disconnect To: The next component when active disconnect is occurred
- Inter Digit Timeout: The max time to in seconds to wait between two digits.
- RTP Route: Voice RTP routing over WG5250 or not, for VoIP to VoIP call
- Finish To: Successfully connect to remote site
- Failed Other to: The next component when default failed call
- Failed Reason: Failed reason selection
- Failed To: When the failed reason occurred go to
- **Line Propriety:**
 - PSTN: PSTN disconnect reason code:
 - Normal Call Clear
 - User Busy
 - No User Response
 - No Answer
 - Call Reject
 - VoIP: VoIP disconnect reason code:
 - User Busy
 - No Answer
 - Unreachable
 - Other

-  PA: Play Announcement

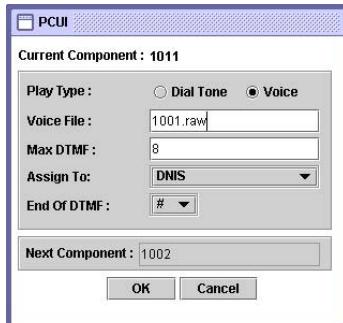

- Dynamic Play: Dynamic play voice file by combine prefix and variable as the file name
- Enable: Combine prefix to variable as the voice file to play
 - Prefix: Voice file prefix (e.g. prefix: WT, variable: user1 (contact 201, played voice file is “WT201.raw”)
 - Variable: Variable to be appending as the voice file name
- Disable: Use filter voice prompt file
 - Voice File: Voice prompt file
- Interrupted: Voice can be interrupted or not

-  PB: Play Balance for prepaid purpose

- Voice File: Voice prompt file
- Language: Play balance language section
 - English
 - Chinese.
- Interrupted: Voice can be interrupted or not

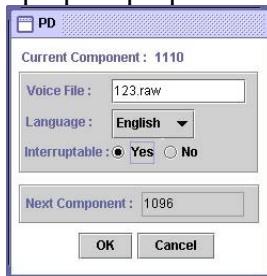

-  PCUI: Prompt and Connect User Information

- Play Type: Dial tone or voice prompt selection
- Voice File: Voice prompt file

- Max DTMF: Maxtor of DTMF to be received.
- Assign To: Result (received DTMF) will be assign to
- End of DTMF: The digit to indicate dial end.
- Interrupted: Voice can be interrupted or not

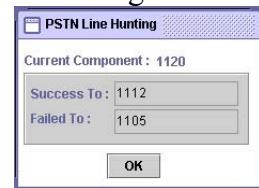

-  PD: Play Duration for prepaid purpose

- Voice File: Leading voice prompt file
- Language: Play duration language section
 - English
 - Chinese
- Interrupted: Voice can be interrupted or not

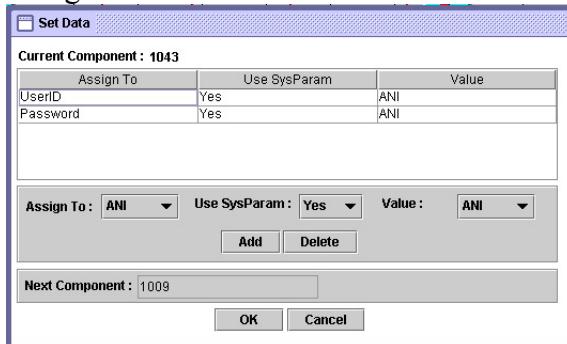

• Note: The RADIUS servers need to be setup to send H.323/SIP credit time or internal RADIUS must be used.

-  PSTN L.H: PSTN Line Hunting

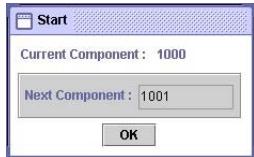

- Success To: If fine an available channel by system setup (call hunting)
- Failed To: If not fine an available channel by system setup (call hunting)

-  Set Data: Assign value to a variable

- Assign To: Assigned variable
- Use SysParam: Use system parameter to replace or not
- Value: ANI, DNIS, User ID or other digits

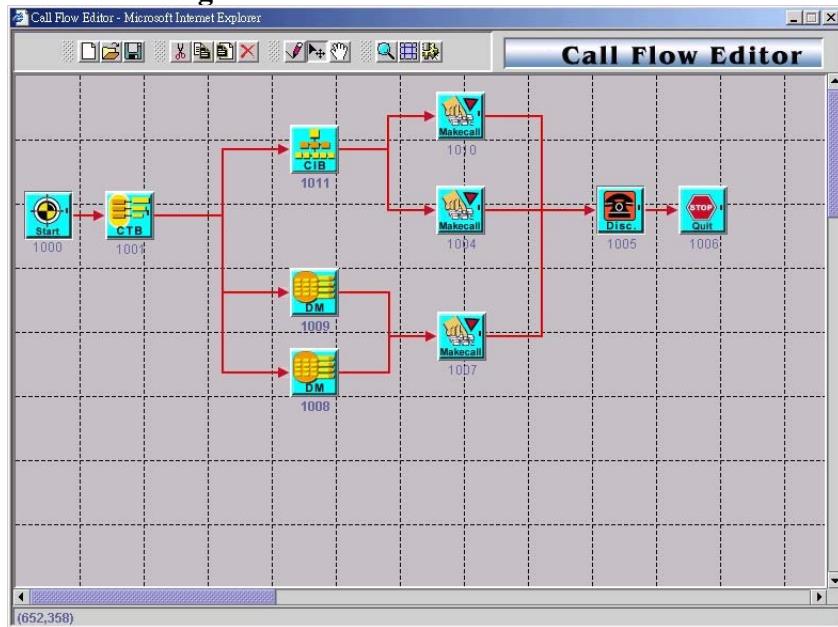

-  Start: Call flow start

- Next Component

-  Quit: Disconnect calls

Example Call Flow as figure 4-3.

Example Description:

Components	Contents
 Start Component ID: 1000	Next Component: 1001
 CTB Component ID: 1001	PSTN To: 1011 H.323 To: 1009 SIP To: 1008
 CIB Component ID: 1011	Info Type: ANI Prefix: 1 goto: 1010 (H.323 GK call) Prefix: 8 goto: 1004 (SIP Proxy call)

1011 Route for PSTN call

 MakeCall Component ID: 1010	Route Mode: Gatekeeper Finish To: 1005 Failed Other To: 1005
 MakeCall Component ID: 1004	Route Mode: SIP Proxy Call Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Next Component: 1006
 Quit	

Component: 1006	
-----------------	--

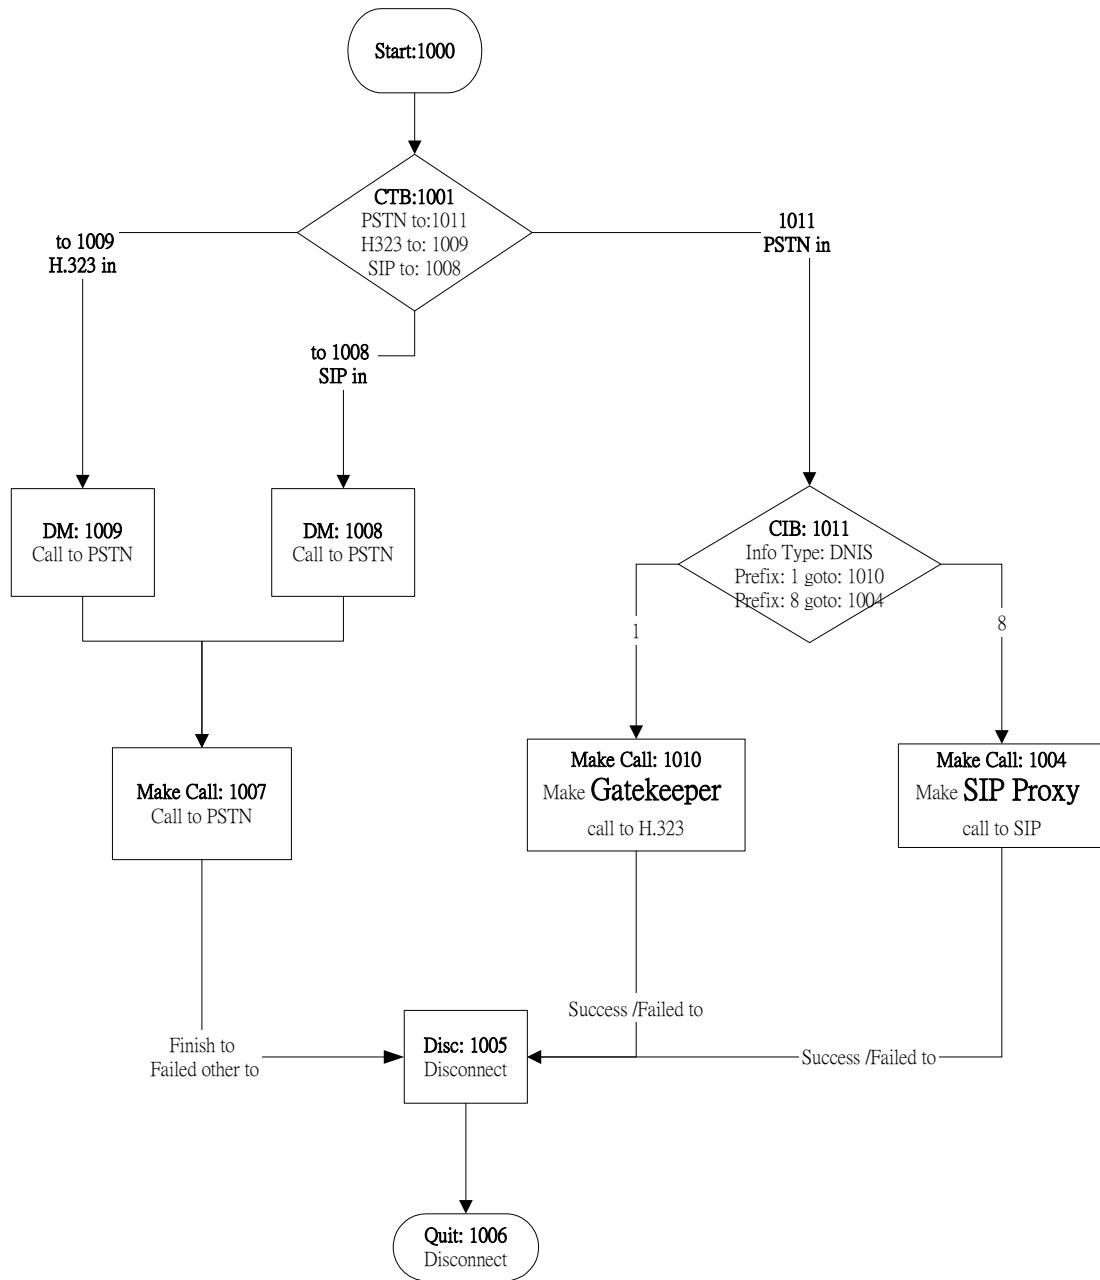

1001 Route for H.323 Gatekeeper call

 DM Component ID: 1009	DM Parameter: DNIS DM Group ID: H.323 In Drop Next Component: 1007
 MakeCall Component ID: 1007	Route Mode: PSTN Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Next Component: 1006
 Quit Component: 1006	

1001 Route for SIP Proxy call

 DM Component: 1008	DM Parameter: DNIS DM Group ID: SIP In Drop Next Component: 1007
 MakeCall Component ID: 1007	Route Mode: PSTN Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Next Component: 1006
 Quit Component: 1006	

Example Used Call Flow:

Configuration Manager

Configuration Management provides a way to save and reload the system configuration for future use.

Load a Configuration:

Step 1: When you need to load a saved configuration, click a saved configuration (i.e. 04/26/2004 Loading Test) item to load it back as figure 4.1-1.

Figure 3.7-1

Step 2: When screen shows “***Current configuration will lost! Are you sure to load this configuration?***” click on **OK** button to load he saved configuration to the working configuration as figure 4.1-1.

Figure 3.8-2

☺Note: It is need to restart the system to take effect of the new-loaded working configuration.

Save the working Configuration:

Step 3: To save the current configuration, select a new created configuration and click **Save** button, when screen shows “***Description***”, please enter the configuration description (i.e. Billing Test) for the saved configuration as figure 4.2-2.

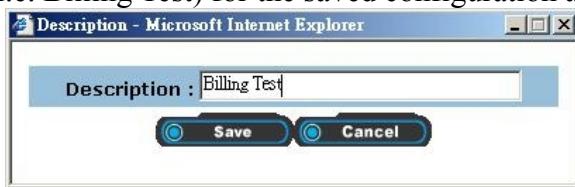

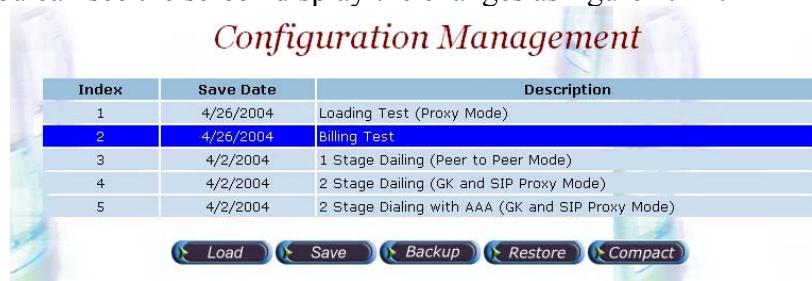

Figure 3.8-3

Step 4: You can see the screen display the changes as figure 4.2-4.

The screenshot shows a configuration management interface with a table titled "Configuration Management". The table has columns for "Index", "Save Date", and "Description". The data is as follows:

Index	Save Date	Description
1	4/26/2004	Loading Test (Proxy Mode)
2	4/26/2004	Billing Test
3	4/2/2004	1 Stage Dialing (Peer to Peer Mode)
4	4/2/2004	2 Stage Dialing (GK and SIP Proxy Mode)
5	4/2/2004	2 Stage Dialing with AAA (GK and SIP Proxy Mode)

Below the table are several buttons: Load, Save, Backup, Restore, and Compact.

Figure 3.8-4

Backup the working configurations:

Step 5: To backup the running configuration, click on **Backup** button, to back up local hard disk. The whole running configuration will be compress into a zip file (file name: export.zip) and transfer back to local as figure 4.2-2.

Figure 3.8-5

Restore configuration:

Step 6: To restore the backup configuration file, click on **Restore** button, when screen shows "**Import Configuration file**", select backup file (i.e. c:\export.zip) click on **Import** button to restore the configuration to the working configuration as figure 4.2-2.

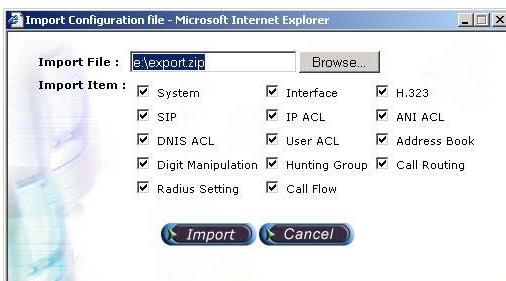

Figure 3.8-6

Compact the database file:

Step 7: In order to optimize the system performance, you can optional compact the database by click **Compact** button as figure 4.1-2.

Figure 3.8-7

©Note: Please make sure that there is no others person to use database concurrently.

Apply Change

When you load a new working configuration, the system must be restarted to take effect.

Step 1: Click Configuration→Apply Change, the screen show “*The change you mode need to restart the system for apply please confirm to restart or do it later.*” Click on OK/Cancel to restart the system or not as figure 4.3-1.

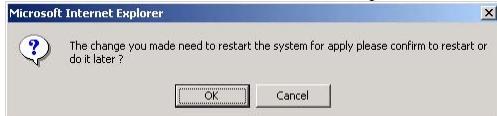

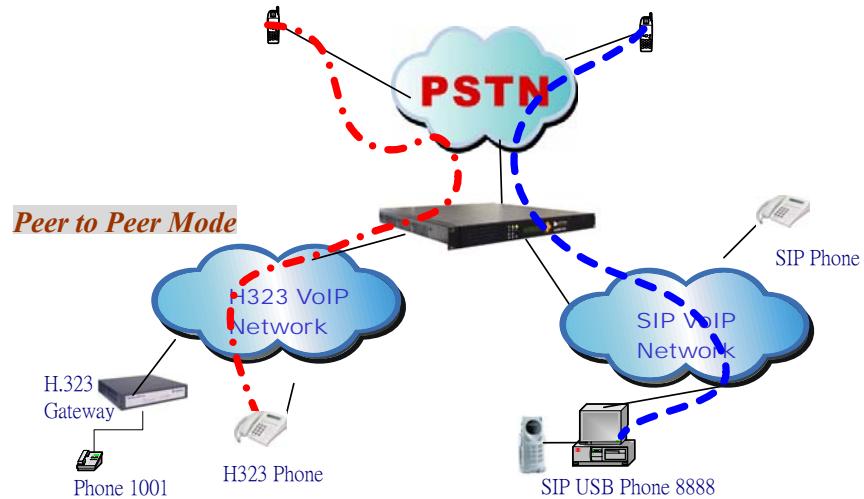

Figure 4.3-1

Chapter 5 Peer to Peer Mode Configuration

Environment used in this chapter

Process:

PSTN → H.323 Call: DNIS (822656991001) → DM (PSTN In Drop) → Make H.323 - Peer to Peer Call (1001)
→ SIP Call: DNIS (822656998888) → DM (PSTN In Drop) → Make SIP - Peer to Peer Call (8888)

H.323 → DNIS (50932123321) → DM (H.323_in_drop) → Make Call (0932123321)

SIP → DNIS (1130028610825123) → DM (SIP_in_drop) → Make Call (0028610825123)

☺ Digit Manipulation: Please refer section "[Digit Manipulation](#)"

Network Configuration

Please refer to section "[Network Configuration](#)"

Account Manager

Please refer to section "[Account Manager](#)"

Interface Configuration

Please refer to section "[Interface Configuration](#)"

H.323 Configuration

Step 1: Change Register To Gatekeeper to “No” to enable peer to peer mode as figure 5.1-1.

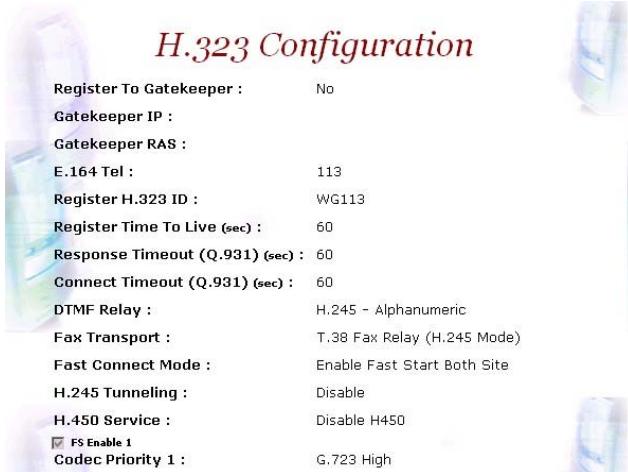

Figure 5.1-1

Frequency used parameters:

- Register to Gatekeeper: No

SIP Configuration

Step 1: Change SIP Register to “No” to enable peer to peer mode as figure 5.2-1.

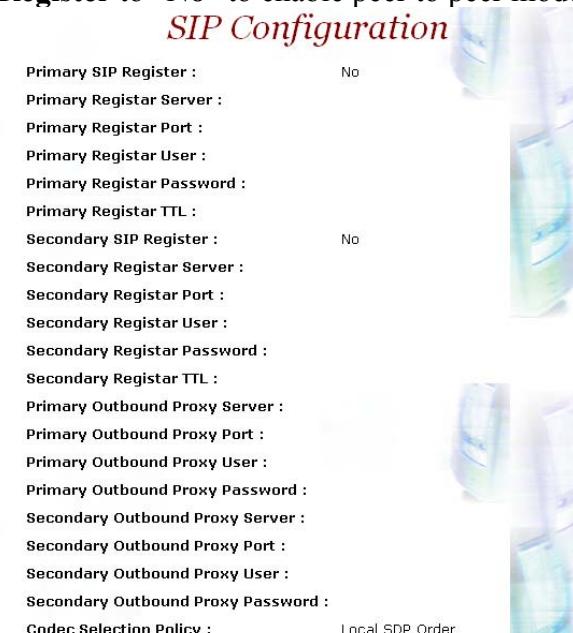

Figure 5.2-1

Frequency used parameters:

- Primary SIP Register: No

Address Book

For making a **Peer-to-Peer** call, the IP device must has an address record in the phone book for routing.

Step 1: Click **Address Book** adds a new address book for the peer to peer calls, New to add as figure 5.3-1.

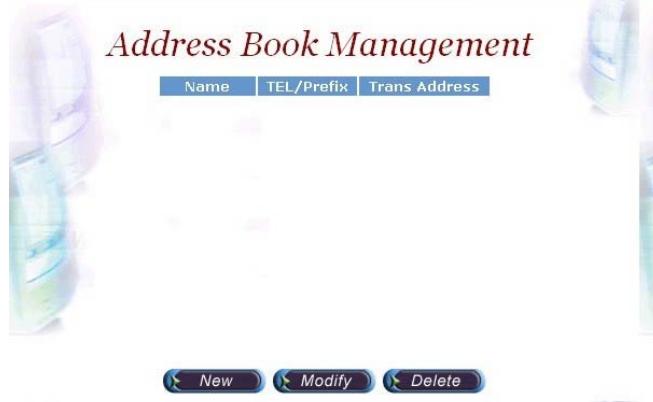

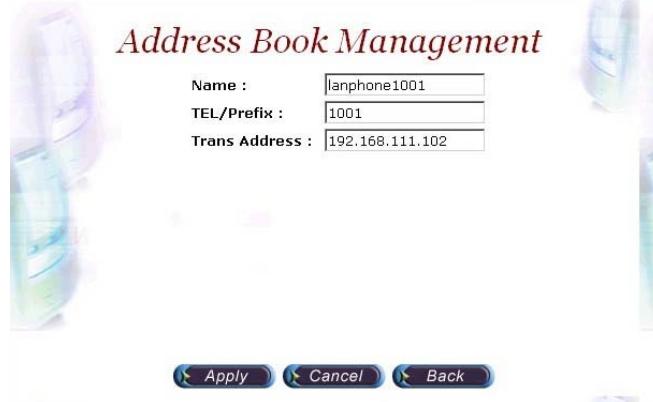

Figure 5.3-1

Step 2: Enter the related parameters and click **Apply** button as figure 5.3-2.

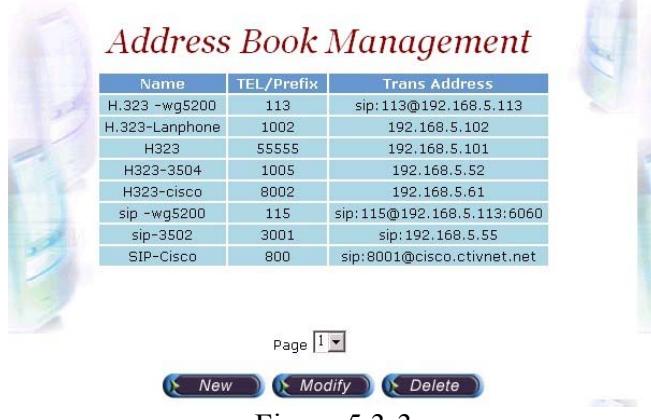

Name :	lanphone1001
TEL/Prefix :	1001
Trans Address :	192.168.111.102

Figure 5.3-2

Field Description:

- Name: H.323-LanPhone or SIP-Cisco
- Tel/Prefix: 1002
- Trans Address:
 - H.323 Call: 192.168.5.102 or 192.168.5.102:1720
 - SIP Call: sip:8001@192.168.5.61 or sip:8001@192.168.5.61:5060 or sip:8001@ctivnet.net

Step 3: You can see the screen displays the new Address Book as figure 5.3-3.

The screenshot shows a software interface titled "Address Book Management". At the top, there is a search bar with placeholder text "Search Address Book". Below the search bar is a table with the following data:

Name	TEL/Prefix	Trans Address
H.323 ~wg5200	113	sip:113@192.168.5.113
H.323-Lanphone	1002	192.168.5.102
H323	55555	192.168.5.101
H323-3504	1005	192.168.5.52
H323-cisco	8002	192.168.5.61
sip ~wg5200	115	sip:115@192.168.5.113:6060
sip-3502	3001	sip:192.168.5.55
SIP-Cisco	800	sip:8001@cisco.ctivnet.net

At the bottom of the interface, there are buttons for "New", "Modify", and "Delete".

Figure 5.3-3

• Note: You must apply the change to take effect for the change.

Chapter 7 Advance Configuration Reference

Configuration

System Configuration

Start Path: Configuration→System

Figure 7.1-1

Parameter Description:

- CDR Mode: Call detail record generating mode (Refer to “[Appendix 3 Retrieve CDR Information](#)” for detail file description)
 - File Only: Log CDR into the file only. It can be retrieved by ftp (directory c:\cd cdr).
 - Radius Start/Stop: Log CDR into the file and send RADIUS start/stop billing message out.
 - VoIP: enable VoIP site RADIUS billing message or not.
 - PSTN: enable PSTN site RADIUS billing message or not.
 - Radius Stop: Log CDR into the file and send RADIUS stop billing message out.
 - VoIP: enable VoIP site RADIUS billing message or not.
 - PSTN: enable PSTN site RADIUS billing message or not.
- CDR Keepdays: CDR system keeping days
- Hot Swappable: Hot swappable support (reserved)
- First Digit Timeout: The max to time (in second) waits for receiving the first digit entered (5~20 sec).
- Inter Digit Timeout: The max to time (in second) waits for the between two digits (5~20 sec).
- Debug Level:
 - Critical: Show critical error messages only
 - Warring: Show warring and critical error message only
 - Information: Show information, warring and critical message only
 - Debug: Show all debug messages
 - Full Trace: Show all status and debug messages

⊕ Note: Please set to “Critical” only, or the whole system performance will be hitted.

- Time Expired Notify: Seconds to be notifying caller before communication expired. This function is used for Pre-Paid calling card service and must cooperate with RADIUS Server.
- Almost Expired Tone: Communication expired notice tone selection

- Fast Response Timeout: The maximum times to wait for response. It's depende on the network speed.
- No Answer Timeout: The maximum the (in second) to wait the remote party answer (pick up phone)
 - Notify Tone#1:
 - Notify Tone#2:
- Authentication Mode: Authentication by WellGate 5250 or RADIUS
 - Internal: Authentication building User ACL
 - External: Authentication by RADIUS
 - Ext. AAA Failure Opt: Bypass or disconnect incoming calls when external
- Version: 5.1

Interface Configuration

Start Path: Configuration→Interface

Figure 7.2-1

Basic Parameter Description:

- Interface ID: System parameter
- Card slot: System parameter
- Interface Type: System parameter
- Description: System parameter
- Serial No: System parameter
- License Key: System parameter
- IP Address: IP address used for voice RTP stream
- Subnet Mask: Submask (doesn't support super class)
- Default Gateway: Default gateway for routing
- PCM Type: PCM type encoding, E1 A-law; T1 u-law

Advance Interface Configuration:

Start Path: Configuration→Interface →Advance

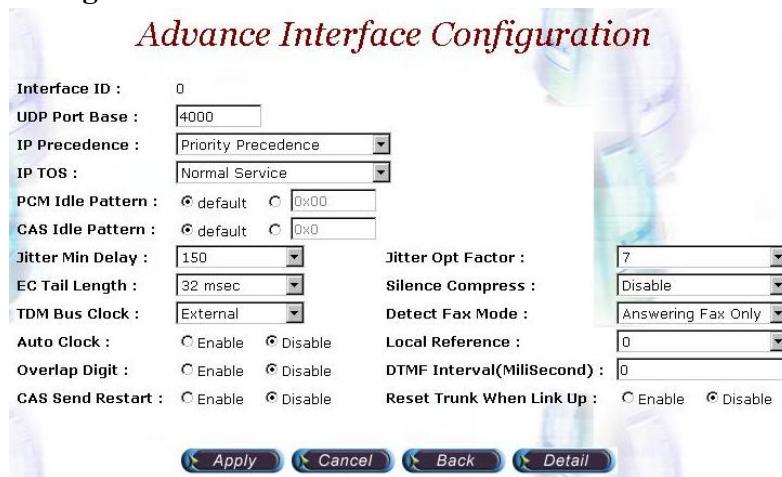

Figure 7.2-2

Advance Parameter Description:

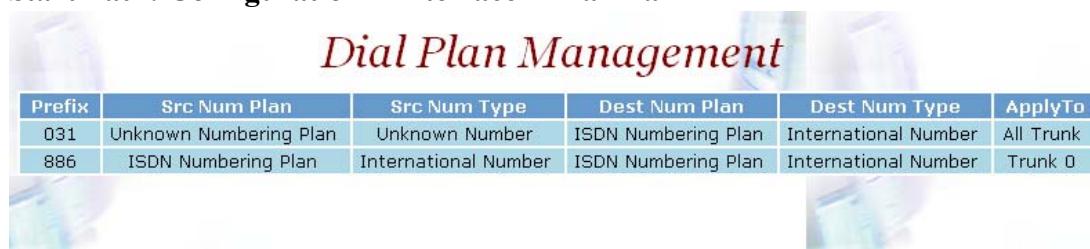

- Interface ID: System parameter
- UDP Port Base: UDP port used for RTP stream, each channel needs 3 RTP ports and must be started by a multiple of 10
- IP Precedence: Voice package priority setting
 - Routine Precedence
 - Priority Precedence
 - Immediate Precedence
 - Flash Precedence
 - Flash Override Precedence
 - Critical Precedence
 - Internetwork Precedence
 - Network Precedence
- IP TOS: Top of Service with the following priority selection
 - Normal Service
 - Minimize Monetary
 - Maximize Reliability
 - Maximize Thought
 - Minimize Delay
- PCM Idle Pattern: This pattern will be sending on each B channel PCM time slot when the channel is idle (not connected). The default value for A-Law is 0xff and for Mu-Law is 0x55. You only change it when SWITCH need.
- CAS Idle Pattern: When channel is idle, ABCD (CAS) pattern to be applied CAS signaling bus
- Jitter Min Delay: The minimum delay time of Jitter buffer. The range is 0 to 150ms. Default value is 150ms. Which has better voice quality but the delay time will be long.

- Jitter Opt Factor: Jitter buffer optimization factor from 0 to 12. The default value is 7. Set to 0 will have lowest voice delay but have bad voice quality. Set to 12 will have long voice delay but with better voice quality
- EC Tail Length: Echo Cancellation Length, default value is 32ms
- Silence Compress: Enable silence compress or not
- TDM Bus Clock: TDM Bus clock source
 - Internal: derived from internal oscillator
 - External: derived from external PSTN E1/T1 clock
- Detect Fax Mode: T.38 fax detecting method
 - Answering Fax only: Detect answer tone to initiate T.38
 - Fast Fax Detect: Detect calling and answer tone for T.38. Use Answering fax only when fast fax detect miss detect a fax call.
- Auto Clock: Automatic detect trunk clock source. It is recommended to specify clock source.
- Local Reference: TDM bus reference clock. Please set to a connected trunk.
- Overlap Digit: Enable Q.931 overlapping sending or not.
- DTMF Interval: Wait overlap digits time out
- CAS Send Restart: When channel is blocked, send restart or not.
- Reset Trunk When Link Up: When trunk is started, restart channels or not.

Dial Plan Configuration

Dial Plan can be used to assign the ISDN number plan based on prefix setting.

Start Path: Configuration→Interface→Dial Plan

Prefix	Src Num Plan	Src Num Type	Dest Num Plan	Dest Num Type	ApplyTo
031	Unknown Numbering Plan	Unknown Number	ISDN Numbering Plan	International Number	All Trunk
886	ISDN Numbering Plan	International Number	ISDN Numbering Plan	International Number	Trunk 0

Figure 7.3-1

Basic Parameter Description:

- Prefix: Called party number prefix
- Src Num Plan: ISDN Source number plan
- Src Num Type: ISDN Source number type
- Dest Num Plan: ISDN destination number plan
- Dest Num Type: ISDN destination number type
- ApplyTo: Trunks apply to

T1/E1 Trunk Configuration

Start Path: Configuration→Interface→Trunk

Trunk Configuration

Interface ID :	0
Trunk ID :	0
Trunk Type :	<input type="radio"/> T1 <input checked="" type="radio"/> E1
Description :	1st Trunk
Termin Side :	User Side
Trunk Mode :	Normal
Hunting Method :	rotary

Inbound DM Group :	None
Outbound DM Group :	None
Local Ring Back :	<input type="radio"/> Yes <input checked="" type="radio"/> No
Channel Mask :	0xffffffff
Clock Master :	<input type="radio"/> On <input checked="" type="radio"/> Off

Figure 7.3-1

Basic Parameter Description:

- Interface ID: System parameter
- Trunk ID: System parameter
- Trunk Type: T1or E1 selection
- Description: Description for this trunk ID
- Termin Side: Network site or User Site (normally, you set to “**user site**” when connect to switch)
 - User Side
 - Network Side
- Trunk Mode: Trunk operation mode
 - Disable: Disable the trunk
 - Normal: Accept PSTN and VoIP calls
 - PSTN incoming only: Allow the PSTN incoming calls only
 - VOIP incoming only: Allow the VOIP incoming calls only
- Hunting Method: PSTN trunk hunting method for available channel
 - Random: Hunt randomly
 - Cyclic: Initial hunt (after power-up/reboot) begins with B channel 1; subsequent hunts begin with position following last successfully allocated resource
 - Rotary: Hunt always begins with B channel 1
 - Reverser Rotary: Hunt always begins with B channel 31
 - Reverser Cyclic: Initial hunt (after power-up/reboot) begins with B channel 31, follows next available channel in reverser order
- CAS Variance: CAS counting variance
- Framing Method:

- **For T1:**
 - super frame
 - 4-frame multi-frame
 - 12 frame multi-frame (D4)
 - extend super frame without CRC6
 - extend super frame with CRC6
 - 72-Frame Multi-Frame
- **For E1:**
 - Automatic CRC4 or Double Frame selection
 - Double Frame Format
 - CRC4 multi-frame
 - CRC4 extend multi-frame
- Protocol Tag: supported protocol on T1/E1 interface with PSTN switch
 - **For T1:**
 - T1 CAS
 - T1 RAW CAS
 - T1 NI2 ISDN
 - T1 4ESS ISDN
 - T1 5ESS 9 ISDN
 - T1 5ESS 10 ISDN
 - T1 DMS100 ISDN
 - T1 NTT ISDN: used to connect NTT INS-1500 ISDN standard (Japan Only)
 - T1 HKT ISDN
 - T1 QSIG
 - T1 EURO ISDN
 - T1 DMS100 MERIDIAL ISDN
 - T1 NI1 ISDN
 - **For E1:**
 - E1 EURO ISDN: used for most of European ISDN standard
 - E1 MFCR2
 - E1 CAS
 - E1 RAW CAS
 - E1 AUSTEL ISDN: Australia E1 ISDN Variance
 - E1 HKT ISDN: Hong E1 ISDN Kong Variance
 - E1 KOR ISDN: Korea E1 ISDN Variance
 - QSIO
 - E1 TNZ ISDN
- Line Code: T1: you can choose AMI, B8ZS; E1: you can choose AMI, HDB3
- PSTN Trace: PSTN layer debug trace. It will generate a debug trace file for tracing purpose. Only enables it under Welltech technical supports instruction and disable it when complete the debug
- Inbound DM Group: Digit Manipulation group used for incoming calls associated to this trunk
- Outbound DM Group: Digit Manipulation group used for outgoing calls
- Local Ring Back: Provide ring back tone for PSTN or not. It only works when VoIP outgoing Fast Start is disabled.
- Channel Mask: Channel mask for incoming or outgoing calls (default: 0xffffffff) Start from MSB each bit, indicate a time, slot a trunk (e.g. 0x0000ffff: 0~15 B channel mask, 17~31 B channel free)

- Clock Master: PSTN trunk clock source

Advance Trunk Configuration:

Start Path: Configuration→Interface →Trunk →Advance

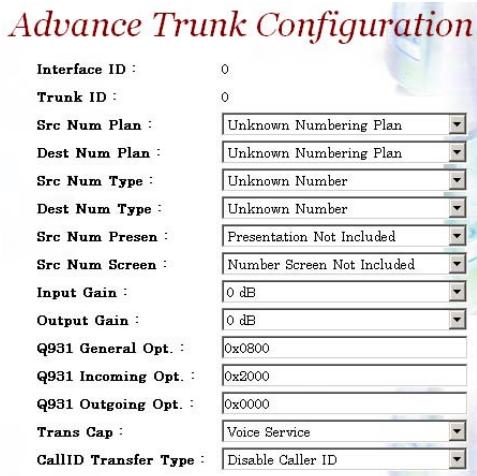

Figure 7.3-2

Advance Parameter Description:

- Interface ID: System parameter
- Trunk ID: System parameter
- Src Num Plan: ISDN source number plan
- Dest Num Plan: ISDN destination number plan
- Src Num Type: ISDN source number type
- Dest Num Type: ISDN destination number type
- Src Num Presen: ISDN source number presentation
- Src Num Screen: ISDN source number display
- Input Gain: Voice Gain from PSTN to IP side (default: 0 db)
- Output Gain: Voice Gain from IP to PSTN side (default: 0 db)
- Q.931 General Opt.: used for Q.931 general behavior.
 - 0x00000001: No sending of STATUS message on receipt of an unknown IE. If this bit is set, then ISDN Stack does not generate a STATUS message after having received a message containing 1 or more unknown/unrecognized IE(s). This bit applies only for network variants for which the sending of STATUS in this case is optional (where recommendation says “a STATUS MAY be returned”)
 - 0x00000002: No sending of STATUS message on receipt of an optional IE with invalid content. If this bit is set, then ISDN Stack does not generate a STATUS message after having received a message containing 1 or more optional IE(s) with invalid content. This bit applies only for network variants for which the sending of STATUS in this case is optional (where recommendation says “a STATUS MAY be returned”).
 - 0x00000004: Unknown/unrecognized Facility IE accepted. If this bit is set, then NS does not reject a received message containing a Facility IE that it does not recognize and acts as if the IE was correct. It applies in network variants where a complete ASN1 decoding is made on Facility IE

- 0x00000080: Only applicable when configuration is Euro ISDN, User-side, outgoing call . If this bit is set, then the board sends a CONNECT_ACK message when receives a CONNECT.
- 0x00000100: Only applicable when configuration is ETSI. If this bit is set, BC and HLC IEs in Alert, CALL_PROC, CONNECT and PROGRESS message are rejected.
- 0x00000200: Only applicable when configuration is 4ESS, DMS, 5ESS, N12 or HKT, NFAS-both incoming and outgoing calls. If this bit is set, then ISDN calls on NFAS have an interface ID different to the default one (refer to NFAS Appendix). The interface ID value is taken from the Boardparam of the NFAS Member Trunk config. (i.e.,board_params.Trunk Config[i].Protocol Specific. ISDN_NFAS_Interface ID).
- 0x00000800: Only applicable when configuration is 4ESS, DMS, 5ESS or N12. If this bit is set, the channel ID is always set to EXPLICIT interface ID, even if the B-channel is on the link bearing the D-channel.
- 0x00008000: Only applicable when configuration is ETSI. If this bit is set, Mu-law (μ -Law) is also accepted. Otherwise, only A-law is accepted.
- 0x00010000: Only applicable when configuration is ETSI. If this bit is set, calling party number octet 3a is always present, even if presentation and screening have default values. Otherwise, usual rule is used.
- 0x00020000: Only applicable when configuration is N12, QSIG or ETSI. If this bit is set, the call is cleared on reception of STATUS with incompatible state. Otherwise, no action is taken
- Q.931 Incoming Opt.: used for Q.931 incoming call behavior
 - 0x00000010: Automatic answering on TELEPHONY incoming calls : When this bit is set, Board sends a CONNECT (answer) message on TELEPHONY incoming calls.
 - 0x00000020: Automatic answering on NOT TELEPHONY incoming calls: When this bit is set, Board sends a CONNECT (answer) message on NOT TELEPHONY incoming calls.
 - 0x00000800: When this bit is set, the ISDN Stack forces the sending of the Channel-id Information Element in the first response to an incoming call indication. When this bit is not set, The ISDN Stack forces it only if it is mandatory for the running operator , or if on NT-side. This have been identified as solving a problem with Coral PBX that requests a ChannId in the first respond to an incoming call from it .
 - 0x00001000: When this bit is set, the ISDN Stack does NOT automatically generate a Setup ack. When this bit is not set, the ISDN Stack sends a Setup Ack when it detects overlap receiving in progress.
 - 0x00002000: When this bit is set, the ISDN Stack forces the sending of Channel-id Information Element(IE) in the Call-Proceeding message. When this bit is not set, the ISDN Stack forces it only if it is mandatory for the running operator, or if on NT-side.
 - 0x00010000: When this bit is set, the board automatically sends a Progress-Indicator #8 (“in-band tones/announcements available”) in the Setup-Ack message that is sent back automatically by the board when it receives and accepts a Setup message in overlap-receiving mode (e.g no digit in the Setup), for Voice calls only (BC encoded as Speech or 3.1-

- Audio). This enables tone generation to the Terminals after handset off-hook.
- Q.931 Outgoing Opt.: used for Q.931 outgoing behavior
 - 0x00000002: Automatic generation of 'Sending-complete' information element in SETUP (as result of Place Call) · When this bit is set , Board does not generate automatically the 'Sending-complete' information element in the SETUP. The User application must request it in the Place Call function. Otherwise (if this bit is not set), the Board generates it automatically in the SETUP message only.
 - 0x00000010: use Mu-law if this bit is set, or A-law will be used. Apply only for Korea variance, you can OR the required option together
 - 0x00000080: When this bit is set, ISDN stack uses the KEYPAD IE to store the called number digits instead of the CALLED_NB IE. Only applicable for KOR variant (Korean network). Useful for Korean switches that do not accept the Called_nb IE.
 - 0x00000100: When this bit is set, ISDN Stack forces the sending of a Channel-id IE in an outgoing SETUP message even if it is not required by the standard(i.e., it is optional only), and no Channel-id was specified in the establishment request. This is useful to increase compatibility with switches that require it . On PRI lines it indicates a not yet used channel id, preferred only.
 - 0x00000200: When this bit is set, ISDN Stack sends G..711 A-Law in outgoing voice calls. When this bit is cleared, ISDN Stack sends default G.711-Mu-Law in outgoing voice calls. Applicable for 5ESS variant (T1).
 - Trans Cap: Transfer Capability
 - Voice Service
 - Data Service
 - Modem Service
 - CallID Transfer Type: Call ID transfer type
 - Disable Caller ID: default parameter
 - Transparent Caller ID
 - Relay Caller ID
 - Bypass Caller ID

Reset Configuration

Reset a channel or a trunk idle state.

Start Path: Configuration→Interface→Detail→Reset

Trunk Configuration

Interface : o Description : VoIP 4 E1/T1 Interface 1

Trunk ID	Description	Trunk Mode	Protocol Tag
0	0	PSTN incoming only	E1_EURO_ISDN
1	1	PSTN incoming only	E1_EURO_ISDN
2	2	VOIP incoming only	E1_EURO_ISDN
3	3	VOIP incoming only	E1_EURO_ISDN

[1]
 Modify Batch Cont Reset Back

Basic Parameter Description:

- Register To Gatekeeper: Register to Gatekeeper or not
 - Yes: Register to GK
 - No: Not register to GK
- Gatekeeper IP: Gatekeeper IP Address
- Gatekeeper RAS: UDP Port number listened on Gatekeeper (default: 1719)
- E.164 Tel: Telephone number to be registered to Gatekeeper
- Register H.323 ID: H.323 alias name to be registered to Gatekeeper
- Register Time To Live (sec): The registration maximum time to live setting when registered to the Gatekeeper
- Response Timeout (Q.931)(sec): The maximum time to wait for response from sending call setup signal out
- Connect Timeout (Q.931)(sec): The maximum time to wait for connection (answer) from dialing out the destination number
- DTMF Relay: DTMF transfer type selection
 - RTP relay (RFC 2833): DTMF relay via RTP packet (RFC2833 standard)
 - DTMF transparent: transmitter DTMF over voice channel
 - H.245 Signal input: DTMF relay via H.245 user signal input
 - H.245 Alphanumeric: DTMF relay via H.245 Alphanumeric signal
 - Q.931 User Information: DTMF relay via Q.931 User to user information
- Fax Transport: Fax transport type selection
 - Transparent mode: Transparent mode (by voice packet)
 - T.38 Fax Relay (H.245 mode): T.38 Fax relay (H.323 Annex D)
 - T.38 Fax Relay (Proprietary mode): T.38 Fax Relay (proprietary mode)
 - FRF11 Fax Relay (Proprietary mode): FRF11 Fax Relay (proprietary mode)
- Fast Connect Mode: Connection of H.323 call fast mode
 - Disable: Don't use Fast Start.
 - Enable Fast Start Both Site: Use Fast Start for incoming call and outgoing H.323 calls
 - Fast Start-H.323 incoming only: Enable Fast Start for H.323 incoming calls only
 - Fast Start-H.323 outgoing only: Enable Fast Start for H.323 outgoing calls only.
 - Early H.245: Use Early H.245
- H.245 Tunneling: Transfer the H.245 message over the Q.931 channel
- H.450 Service: Enable the H.450 calls transfer service
- FS Enable 1-6 (Codec Priority 1-6): Enable Fast Start codec selection for each codec
- Inbound DM Group: Digit Manipulation Group for H.323 incoming calls
- Outbound DM Group: Digit Manipulation Group for H.323 outgoing calls

Advance H.323 Configuration:

Start Path: Configuration→H.323→Advance

Advance H.323 Configuration

RAS Multicast IP :	
RAS Multicast Port :	
Max Call :	500
Max Channels :	10
RAS Port :	1719
Q.931 Port :	1720
T.38 ECM Mode :	T.38 ECM Interoperable
Fax RDepth :	2
H.245 Option :	
G.723 Psize :	30 ms
G.729 Psize :	20 ms
G.711 Psize :	20 ms
Wait H323 Idle Timeout (sec) :	5
H.323 Delay Drop Timeout (msec) :	100

Figure 7.5-2

Advance Parameter Description:

- RAS Multicast IP: RAS multicast IP for Gatekeeper searching
- RAS Multicast Port: RAS multicast Port for Gatekeeper searching
- Max Call: The maximum H.323 calls
- Max Channel: The maximum channel of each H.323 call
- RAS Port: Local RAS port (default: 1719)
- Q.931 Port: Local TCP port number of Q.931
- T.38 ECM Mode: T.38 Error Correction Mode
 - T.38 ECM Interoperable mode
 - T.38 ECM Backward Compatible Mode
- FAX Rdepth: T.38 relay redundancy packet depth for high-speed mode.
- H.245 Option: Separate the H.245 channel in the call of the Fast Start mode or not.
- G.723 Psize: G.723 transmission packet size in ms (default: 30ms)
- G.729 Psize: G.729 transmission packet size in ms (default: 20ms)
- G.711 Psize: G.711 transmission packet size in ms (default: 20ms)
- Wait H323 Idle Timeout (sec): Max time to wait H.323 idle when call is in disconnected state. After time out, the call will be terminated.
- H.323 Delay Drop Timeout (msec): Delay to drop a H.323 call.

SIP Configuration

Start Path: Configuration→SIP

SIP Configuration

Primary SIP Register :	Yes
Primary Registrar Server :	192.168.19.150
Primary Registrar Port :	5060
Primary Registrar User :	173
Primary Registrar Password :	*****
Primary Registrar TTL :	120
Secondary SIP Register :	Yes
Secondary Registrar Server :	192.168.19.157
Secondary Registrar Port :	5060
Secondary Registrar User :	173
Secondary Registrar Password :	*****
Secondary Registrar TTL :	120
Primary Outbound Proxy Server :	192.168.19.150
Primary Outbound Proxy Port :	5060
Primary Outbound Proxy User :	173
Primary Outbound Proxy Password :	*****
Secondary Outbound Proxy Server :	192.168.19.157
Secondary Outbound Proxy Port :	5060
Secondary Outbound Proxy User :	173
Secondary Outbound Proxy Password :	*****

Figure 7.6-1

Basic Parameter Description:

- Primary SIP Register: Register to SIP proxy server or not
 - Yes: Register to proxy server
 - No: Not register to proxy server
- Primary Register Server: SIP register proxy server IP Address
- Primary Register Port: SIP register proxy server port number (default: 1719)
- Primary Register User: SIP register proxy server User ID
- Primary Register Password: SIP register proxy server User Password
- Primary Register TTL: The registration maximum time to live setting when registered to the SIP proxy server
- Secondary SIP Register: Register to SIP proxy server or not
 - Yes: Register to proxy server
 - No: Not register to proxy server
- Secondary Register Server: SIP register proxy server IP Address
- Secondary Register Port: SIP register proxy server port number (default: 1719)
- Secondary Register User: SIP register proxy server User ID
- Secondary Register Password: SIP register proxy server User Password
- Secondary Register TTL: The registration maximum time to live setting when registered to the SIP proxy server
- Primary Outbound Proxy Server: The IP address of an outbound Proxy the SIP Stack uses.
- Primary Outbound Proxy Port: The port of an outbound Proxy the SIP Stack uses
- Primary Outbound Proxy User: The User ID of an outbound Proxy the SIP Stack uses.
- Primary Outbound Proxy Password: The password of an outbound Proxy the SIP Stack uses.
- Secondary Outbound Proxy Server: The IP address of an outbound Proxy the SIP Stack uses.

- Secondary Outbound Proxy Port: The port of an outbound Proxy the SIP Stack uses
- Secondary Outbound Proxy User: The User ID of an outbound Proxy the SIP Stack uses.
- Secondary Outbound Proxy Password: The password of an outbound Proxy the SIP Stack uses.
- Codec Selection Policy: Selection order to match the remote SDP for codec selection.
 - Local SDP Order: Use local SDP order to match codec
 - Remote SDP Order: Use Remote SDP order to match codec
- Local Codec 1~4: Codec selection priority (1 to 4) (1: highest, 4: lowest)
- G.723 Bit Rate Used: G.723.1 high bits rate (6.3k) or low bit rate (5.3k) is used
- 180 SDP: Set SDP for 180 ring message
- 183 SDP: Set SDP for 183 call progress indication.
- DTMF Relay Method: DTMF transport type selection
 - Transparent: transmit DTMF over audio channel
 - SIP INFO: Use SIP INFO Message to relay DTMF
 - RFC2833: Use RFC2833 for DTMF over RTP packet
 - RFC2800 Payload Type: RTP payload type used for RFC2833 DTMF relay
- Fax Transmission: Fax transparent type selection
 - T.38 Fax Relay: T.38 fax relay
 - Transparent: Transparent mode (by voice packet)
- Accept Proxy Call Only:
 - Yes: Only call from outbound proxy server is allowed
 - NO: Accept any SIP calls
- Inbound DM Group: Digit Manipulation Group for SIP incoming calls
- Outbound DM Group: Digit Manipulation Group for SIP outgoing calls

Advance SIP Configuration:

Start Path: Configuration→SIP→Advance

Advance SIP Configuration

TCP Enable :	No
Max TCP Connection :	
Outbound Use TCP :	
Register Use TCP :	
TCP Port :	
UDP Port :	5060
Reliable Provision (100rel) :	No
Max Call Leg :	300
Max Transaction :	1200
Max Register Client :	2
Send Receive Buffer Size :	8192
Reject Unsupported Extension :	Yes
Message Pool Page Size :	1024
General Pool Page Size :	1024
Application Pool Page Size :	1024
Retransmission T1 :	2000
Retransmission T2 :	4000
Retransmission T4 :	5000
Invite Linger Timer :	32000
General Linger Timer :	32000
Default Linger Timer :	100000

Figure 7.6-2

Advance Parameter Description:

- TCP Enable: Receive SIP TCP call or not.
- Max TCP Connection: Max Call: The maximum SIP TCP calls.
- Outbound Use TCP: Use SIP TCP for outbound call or not. If it set to no, UDP is used.
- Register Use TCP: Use SIP/TCP to register to SIP register.
- TCP Port: The local TCP port on which the SIP Stack listens.
- UDP Port: The local UDP port on which the SIP Stack listens.
- Reliable Provision: Support PRACK or not (100rel)
- Max Call Leg: The maximum number of call-legs the SIP Stack allocates. You should set this value to the maximum number of call your expect the SIP Stack to handle simultaneously.
- Max Transaction: The maximum number of transactions the SIP Stack allocates. You should set this value to the maximum number of call your expect the SIP Stack to handle simultaneously.
- Max Register Client: The maximum number of Register-Clients the SIP Stack allocates. You should set this value to the maximum number of call your expect the SIP Stack to handle simultaneously.
- Send Receive Buffer Size: The buffer size used by SIP Stack for receiving and sending SIP messages.
- Reject Unsupported Extension: Yes or No
- Message Pool Page Size: Used to hold and process all incoming and outgoing message in the from of encoded messages or message objects. It is recommended that you configure the page size to the average message size your system is expected to message.
- General Pool Page Size: Used by SIP Stack objects, such as call-legs and transaction, to store the internal fields. For example, the call-legs object will store the To, From and Call-ID headers and the local and the remote contact addresses on the general pool pages. The general pool is also used from other activities that demand memory allocation.
- Application Pool Page Size: The size of page in the application pool
- Retransmission T1: T1 determines several timer as defined in RFC3261. For example, when an unreliable transport protocol is used, a Client Invite transaction retransmits requests at an interval that start at T1 seconds and doubles after every retransmission. A Client General transaction retransmits requests at an interval that starts at T1 and doubles until it reaches T2. (Default Value: 500)
- Retransmission T2: Determines the maximum retransmission interval as defined in RFC3261. For example, when an unreliable transport protocol is used, general requests are retransmitted at an interval which starts at T1 and doubles until reaches T2. If a provisional response is received, retransmission continue but at an interval of T2. (Default Value: 4000)
- Retransmission T4: T4 represents the amount of time the network takes to clear message between client and server transactions as defined in RFC3261. For example, when working with an unreliable transport protocol, T4 determines the time that UAS waits after receiving an ACK message and before terminating the transaction. (Default Value: 5000)

- Invite Linger Timer: After sending an ACK for an INVITE final response, a client cannot be sure that the server has received the ACK message; the client should be able to retransmit the ACK upon receiving retransmissions of the final response for inviteLingerTimer milliseconds.
- General Linger Timer: After a server sends a final response, the server cannot be sure that the client has received the response message. The server should be able to retransmit the response upon receiving retransmissions of the request for generalLingerTimer milliseconds. (Default Value: 32000)
- Provisional Timer: When a client receives a provisional response, it continues to retransmit the request, but with an interval of provisionalTimer milliseconds.
- Cancel General No Response Timer: When sending a CANCEL request on a General transaction, the User Agent waits cancelGeneralNoResponseTimer milliseconds before timeout termination if there is no response for the cancelled transaction.
- Cancel Invite No Response Timer: When sending a CANCEL request on a Invite transaction, the User Agent waits cancelInviteNoResponseTimer milliseconds before timeout termination if there is no response for the cancelled transaction.
- General Request Timeout Timer: After sending a General request, the User Agent waits for a final response generalRequestTimeoutTimer milliseconds before timeout termination (in this time the User Agent retransmits the request every T1, 2*T1,...T2,...milliseconds)
- 183 to Alerting: When receive a SIP 183 message from remote site, send Alerting in stead of Call Progress Indicator
- AutoSend 183: WellGate5250 always send Call Progress Indicator (SIP 183) to VoIP party. It can be used for CAS protocol to enable early media.
- Behind NAT: Does WellGate 5250 is located behind NAT or not
- Public Signal IP: The static mapped IP for SIP signal
- Public Signal Port: The static mapped Port for RTP stream
- Public RTP IP: The static mapped RTP IP
- Public RTP Port: The static mapped RTP starting port
- Public RTP Port Interval: The WellGate 5250 has at least 30 RTP channels. Each channel needs 3 ports mapping on NAT Server. The interval is used to calculate the right port for each channel.
- Overload Redirect: SIP overload redirect when WellGate5250 is not able for service the call
- Redirect Host: Redirect host URI (format: user@siphost, siphost)
- Redirect Port: Redirect port number
- Send 487 When Recv CANCEL: When receive CANCEL form remote site, send “487 Request canceled” or not
- Caller ID Mode:
 - Local: use WellGate 5250 proxy user id
 - Caller: use SIP calling party ANI
- Receive Hold music source:
 - Auto: Auto determinate to play hold tone based on SIP signaling.
 - Local: Play hold tone locally.
- On Hold music: Hold tone music file name

- SIP UnRegist When Trunk Down: Enable or disable unregister when all trunks is down. It can be used for load balancing.
- SIP OverLoad Reason: When all trunk are busy, the reason to send to caller. Default is 438. When work with WS6500, 438 is required for load balancing hunting.
- Refer Call Use Refer By User: When a call is been transferred, new call will use REFER-BY ID instead of original caller ID.

Behind NAT Example 1:

	WellGate 5250	NAT Server Setting
One-by-One Static IP Mapping	192.168.111.112	210.59.163.11
Static Port Mapping	192.168.111.111:5060	210.59.163.10:10000

WellGate 5250 NAT Enable Setting:

Public Signal IP: 210.59.163.10

Public Signal Port: 10000

Public RTP IP: 210.59.163.11

Public RTP base port: 4000 (same as “Interface→Advance’s Config”)

Public RTP Port Interval: 10

Behind NAT Example 2:

	WellGate 5250	NAT Server Setting
Static Port Mapping	192.168.111.111:5060	210.59.163.10:5060
RTP Channel 01	192.168.111.112:4000 4001 4002	210.59.163.10:10000 10001 10002

RTP Channel 02	192.168.111.112:4010 4011 4012	210.59.163.10:10003 10004 10005
.	.	.
RTP Channel 30	192.168.111.112:4310 4311 4312	210.59.163.10:10357 10358 10359

WellGate 5250 NAT Enable Setting:

Public Signal IP: 210.59.163.10

Public Signal Port: 5060

Public RTP IP: 210.59.163.10

Public RTP base port: 10000 (same as “Interface→Advance’s Config”)

Public RTP Port Interval: 0

Access Control

Access Control list can be used to filter the calls from the IP Network, DNIS, and ANI. *It must be used in call flow edit to take effect.*

IP ACL

Start Path: Configuration→Access Control→IP ACL

IP ACL Configuration

IP Network	Access Mode
192.168.19.0	allowed
192.168.19.222	disallow
192.168.19.25	disallow

Figure 7.7-1

Parameters:

- IP Network: IP Address or prefix used to be filtered
- Access Mode:
 - Allow: the inputs IP Network are allowed for calls.
 - Disallow: The inputs IP Network are disallowed for calls.

⦿ Note: If in the system has both allowance and disallowance setup, the system will check allowance first and disallowance later. If only disallowance inputted all IP will allow to work except disallowed network. If only allowance inputted, only those IP from allowance list will work.

ANI ACL

ANI ACL

Start Path: Configuration→Access Control→ANI ACL

ANI ACL Configuration

ANI	Access Mode
2	allowed
282265555	allowed
282265699	disallow

Figure 7.7-2

Parameters:

- ANI: Calling party number used to filter
- Access Mode:
 - Allow: the calling numbers are allowed for calls
 - Disallow: The calling numbers are disallowed for calls

⦿ Note: If in the system has both allowance and disallowance setup, the system will check allowance first and disallowance later. If only disallowance inputted all ANI will allow to work except disallowed ANI. If only allowance inputted, only those ANI from allowance list will work.

DNIS ACL

Start Path: Configuration→Access Control→DNIS ACL

DNIS ACL Configuration

DNIS	Access Mode
886	allowed
8867	disallow

Figure 7.7-3

Parameters:

- DNIS: Called party number used for filter
- Access Mode:
 - Allow: The called numbers are allowed for calls
 - Disallow: The called numbers are disallowed for calls

⦿ Note: If in the system has both allowance and disallowance setup, the system will check allowance first and disallowance later. If only disallowance inputted all DNIS will allow to work except disallowed DNIS. If only allowance inputted, only those DNIS from allowance list will work.

User ACL

User ACL is used to store subscriber information when internal AAA is enabled.

Start Path: Configuration→Access Control→User ACL

User ACL Configuration

User ID	Password	Prepaid Point	Status
0001	*****	9999	Active
0002	*****	48168	Active
0003	*****	48170	Inactive
0004	*****	Postpaid	Inactive
0005	*****	48124	Active
0006	*****	846988	Active
0007	*****	944996	Active
0008	*****	79737851	Active
0009	*****	9735867	Active
0010	*****	Postpaid	Inactive

Page

    

Figure 7.7-4

Parameters:

- User: User ID (0~9, *#)
- Password: Password (0~9, *#)
- Prepaid Point: Allowed prepaid point (When prepaid point is used, the system will deduct it automatically base on the rate setting.)
 - Postpaid: postpaid user
- Status:
 - Active: User is activeled
 - Inactive: User is inactived

⦿ Note: 1. IP Authentication method must be set to “internal AAA” to talk effect.

New a Calling Rate: The calling rate will have different appearance for different calling rate policy set in RADIUS configuration.

Click **Calling Rate** button to add a new calling rate as figure 7.7-5.

Calling Rate

TEL Prefix	Calling Rate(Point)
*	53
8862	96
8864	88
8867	60

Figure 7.7-5

Point per Second calling rate:

Calling rate (point per second) is used to convert prepaid point into prepaid time in second. For example, you can set calling rate to 5 for “100” prefix. When a caller, which has 200 prepaid point, calls “100xxxx”, the max talk time will be $200/5=40$ seconds. If a calling rate is set to “0”, it means free charge.

New a Calling Rate (Second per Point):

Click **Calling Rate** button to add a new calling rate as figure 7.7-6.

Calling Rate

TEL Prefix	Calling Rate(Second)	Charge Point
*	60	1.5
8862	60	3.5
8864	60	3.3
8867	60	3.9

Figure 7.7-6

Second per Point calling rate:

Calling rate (Second per point) is used to convert prepaid point into prepaid second in time. For example, you can set calling rate (Second) to 6, charge point to 1 for “113” prefix. It means that every 6 seconds charge 1 point. When a caller, which has 200 prepaid point, calls “113xxxx”, the max talk time, will be $200*6/1=1200$ seconds.

⌚Note: Tel prefix * is used as a default rate, you need to create it to work.

Search Condition:

You can search a user by User ID, Prepaid or Postpaid condition as figure 7.7-7.

Figure 7.7-7

Number Replace

The purpose of “Number Replace” is to replace called number or calling number for PSTN or IP. **It must be used in call flow to take effect.**

Step 1: It is useful for real PSTN number to virtual VoIP number replacement. Click **Number Replace** to add a new Number Replace Group, add as figure 7.8-1.

Number Replace Configuration	
Group ID	Description
1	SIP IN
2	SIP Proxy 2 in
3	H323 GK in

Figure 7.8-1

Field Description:

- Group ID: 1 (Number Replace Group identify)
- Description: SIP in

Step 2: Click the New created NR and **Detail** button to add digits setting as figure 7.8-2.

Number Replace Detail		
Group : 2	Description : SIP Proxy 2 in	
Original Number	Target Type	Target Number
070899	ANI	99998888
2333	ANI	99998888
6986	ANI	99998888

Figure 7.8-2

Field Description:

- Original Number: Original number filter
- Target Type: ANI or DNIS
- Target Number: The ANI or DNIS are change to target number

Routing Plan

The purpose of **Routing Plan** is to select T1/E1 trunk and channels by your preference when there is a call from IP side to PSTN side. **The PSTN must be used in call flow edit or line hunting component to take effect.**

Hunting Group

Start Path: Configuration→Routing Plan→Hunting Group

Hunting Group Configuration		
Group ID	Description	Hunting Method
1	Chan 1 Trunk 00	Round Robin
2	Chan 2 Trunk 00	Round Robin
3	CHT Trunk 01	Priority
4	FET Trunk 02 and 03	Random

Figure 7.9-1

Parameters:

- Group ID: Hunting Group ID
- Description: Description of Hunting Group
- Hunting Method: Route selection
 - Random: Random select a trunk within this hunting group
 - Priority: Select a trunk by priority. (Priority 1 has lowest priority; 9 has highest priority)
 - Round Robin: Call is hunting rotationally

Start Path: Configuration→Routing Plan→Hunting Group→Detail

Hunting Group Detail			
Group : 4 Description : FET Trunk o2 and o3			
Interface ID	Trunk ID	Priority	Channel Mask
0 · VoIP 4 E1/T1 Interfa.	2 · 2	8	0x0000ffff
0 · VoIP 4 E1/T1 Interfa.	3 · 3	9	0xffffffff

Figure 7.9-2

Parameters:
Group: 4 Description: FET Trunk 02 and 03

- Interface ID: Interface ID
- Trunk ID: trunk id for group 4
- Priority: Trunk priority
- Channel Mask: Channel mask for incoming or outgoing calls (refer [T1/E1 Trunk Configuration](#))

◎Note: When a Route Plan channels mask is cooperated to trunk channel mask to decide the channel availability 17~31 channels are available:

Example 1:

Trunk ID: 0 channel mask: 0xffffffff

Route Plan channel mask: 0x0000ffff

Available channel: 0x0000ffff (17~31) channels.

Example 2:

Trunk ID: 0 channel mask: 0xffff0000

Route Plan channel mask: 0xffc00000

Available channel: 0xffc00000 (1~9) channels.

Call Routing

The call routing can be used for hunting a PSTN trunk by prefix.

Start Path: Configuration→Routing Plan→Call Routing

Call Routing			
Group Id	Number To Route	Matched ANI Prefix	Allow Use Others
3 - CHT Trunk 01	0932	no extra match	Forbad
3 - CHT Trunk 01	0933	no extra match	Forbad
4 - FET Trunk 02 and 03	0936	2	Forbad
2 - Chan 2 Trunk 00	173	070900002	Forbad
1 - Chan 1 Trunk 00	173	07090000	Forbad

Figure 7.9-3

Parameters:

- Group ID: Select the T1/E1 according to the selection of Hunting Group ID when dialed number is matched
- Number To Route: The dialed telephone number to be matched
- Matched ANI Prefix: Calling party number used to filter
- Allow Use Others: To select other T1/E1 trunk when all trunk are busy at your desired Hunting Group.
 - Allowed: The call will use other T1/E1 trunks which is not belong to the selected hunting group
 - Forbad: The call will be disconnected immediately

Radius Setting

When you have an external RADIUS server to do the AAA (Authorization, Authentication and Accounting), enter the correct parameter to the Radius setting. **It must be used in call flow to take effect.**

Start Path: Configuration→Radius Setting

Radius Configuration

Auth IP :	192.168.111.1	Auth Port :	1812
Acct IP :	192.168.111.1	Acct Port :	1813
Backup Auth IP :	192.168.111.1	Backup Auth Port :	1812
Backup Acct IP :	192.168.111.1	Backup Acct Port :	1813
Secret Key :	*****	Max Retry :	3
Response Timer (sec) :	10	Auth Retry Interval (sec) :	3
Acct Retry Interval (sec) :	10	Switch Threshold :	20
Auto Inactive :	All User	Auto Clean :	Prepaid Use
Inactive Prepaid :	3	Clean Filter :	None
Inactive Period :	1	Clean Period :	1
Charge Method :	Point per Second		

Figure 7.10-1

Parameters:

- Auth IP: Radius Authentication Server IP address (default)
- Auth Port: Radius Authentication Server Port
- Acct IP: Radius Account Server IP address
- Acct Port: Radius Account Server Port
- Backup Auth IP: Backup Radius Authentication Server IP address
- Backup Auth Port: Back Radius Authentication Server Port
- Backup Acct IP: Back Radius Account Server IP address
- Backup Acct Port: Back Radius Account Server Port
- Secret Key: The shared secret key with RADIUS Server
- Max Retry: The maximum retry times
- Response Time (sec): The maximum wait for response time from RADIUS Server
- Auth Retry Interval (sec): The internal to resend the Authentication packet to RADIUS Server.
- Acc Retry Interval (sec): The internal to resend the Account packet to RADIUS Server.
- Switch Threshold: Switch to alternate RADIUS Server when failures are occurred more than switch threshold.
- Auto Inactive: Auto inactive an unused or not
 - Disable: Don't auto inactive
 - Prepaid User: Auto inactive prepaid user only
 - Postpaid User: Auto inactive postpaid user only
 - All User: Auto inactive all unused user
- Inactive prepaid: The minimum credit point threshold for a prepaid user to be inactived
- Inactive Period: The max unaccess days for a postpaid user to be inactived
- Charge Method: Billing charge method selection
 - Point per Second: Point / calling rate = seconds
 - Second per Point: Point * calling rate / charge point = seconds
- Auto Clean: Auto clean the inactive user
 - Disable: Don't auto clean inactive user
 - Prepaid User: Auto clean prepaid user only
 - Postpaid User: Auto clean postpaid user only
 - All User: Auto clean inactive user
- Clean Filter: Auto clean filter
 - None: Auto clean users exceed clean period without access the network
 - Inactive: Auto clean only to inactive users
- Clean Period: The maximum unaccess days to clean up. When the clean filter is set Inactive, the unaccess day is start counting when the user is inacived

Apply Change

1. Some of modification needs to restart system before it is effective to system operation. “Apply the change” shows “***The change you made need to restart the system for apply please confirm to restart or do it later?***” Click on OK button to reboot the system.

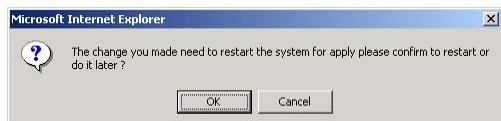

Figure 7.11-1

2. For the modification can be changed to fly, “Apply the Change” shows “***Are you sure to apply the running system?***” Click on OK button to take effecting.

Figure 7.11-2

Chapter 8 System Control

System

Start path: Click Control→System

Figure 8.1-1

Parameter:

- Soft Reset: Soft Reset at WellGate 5250
- Restart: Restart the WellGate 5250
- Shutdown: Shutdown the WellGate 5250

System Time

Timezone Setting

Step 1: If you would like to use timezone, click **Timezone** button to setup the system timezone as figure 8.2-1.

Figure 8.2-1

Standard:

Step 2: Select the **Standard** option to setup the system predefined time zone as figure 8.2-2

Figure 8.2-2

Parameter:

- Time Zone:
 - Standard: Use a predefined standard time zone (**Refer [Timezone to Country Mapping List](#)**)
 - Customize: Use a user defined time zone
- Auto Daylight Saving: Auto adjust daylight saving time or not

User defined timezone :

Step 3: Select the **Customized** option and enter the time zone bias to set a user defined timezone as figure 8.2-3

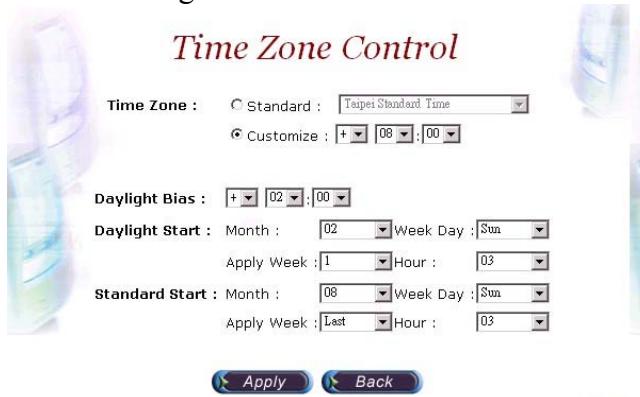

Figure 8.2-3

Parameter:

- Daylight Bias: The offset added to the Bias when the time zone is in daylight saving time
- Daylight Start: The date that a time zone enters daylight time
 - Month: 01 to 12
 - Week Day: Sunday to Saturday
 - Apply Week (Day:01 to 05, Specifies the occurrence of day in the month; 01 = First occurrence of day, 02 = Second occurrence of day, ...and 05 = Last occurrence of day)
 - Hour: 00 to 23
- Standard Start: The date that a time zone enters daylight time
 - Month: 01 to 12
 - Week Day: Sunday to Saturday
 - Apply Week (Day:01 to 05, Specifies the occurrence of day in the month; 01 = First occurrence of day, 02 = Second occurrence of day, ...and 05 = Last occurrence of day)
 - Hour: 00 to 23

Network

DNS Server Setting:

Step 1: After successfully logon to the system, we need to change the network configuration. Click **Control→Network** to setup the network parameters as figure 8.3-1.

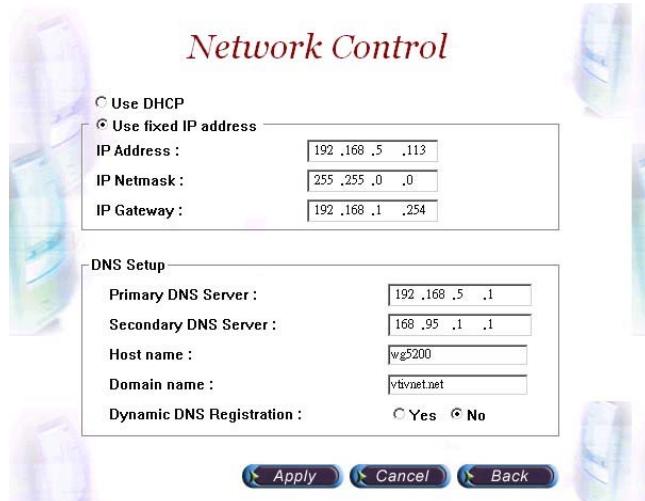

Figure 8.3-1

Parameter:

- Primary DNS Server: Primary DNS Server IP network
- Secondary DNS Server: Secondary DNS Server IP network
- Host Name: Host name used to register to DNS Server
- Domain Name: Domain name used to
- Dynamic DNS Registration: Enable Dynamic DNS registration or not

SNMP

Start path: Click **Control→SNMP→Community**

Figure 8.4-1

Parameter:

- Community Name: Community name for network manager system accessing
- Access Rights: Giving access right to the community

Start path: Click Control→SNMP→Trap

Figure 8.4-2

Parameter:

- Trap Community: Trap community name for NMS
- Trap Host: Trap host IP address

⌚Note: It takes around 1-minute to update SNMP configuration and display successful message.

Prompt Manager

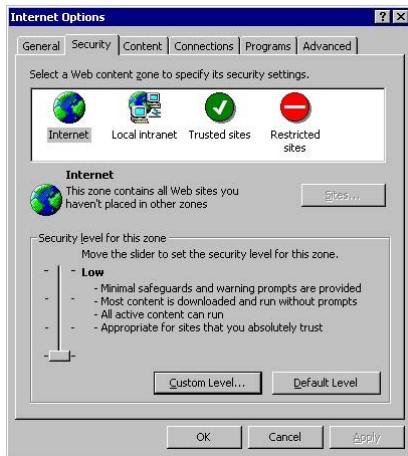

Start path: Click Control→Prompt Manager

Figure 8.4-1

● Note:

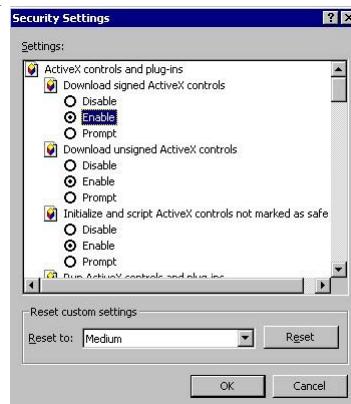

1. You must have a sound card in your PC to record the voice. You need to set Network security in order to execute this recording. Click Tool→Internet Option→Security→Custom Level.

2. Enable the following security to active setting:

Voice prompt editor:

- Download unsigned ActiveX control: Enable
- Initialize and script ActiveX control not marked as safe: Enable

  **New, Record:**

Step 1: Make sure you have installed microphone or other device when you want to record, Click **New** and **Record** buttons to record as figure 8.4-2.

Figure 8.4-2

   **Stop, Pause, Play:**

Step 2: Click **Stop** or **Pause** button to stop record, and click **Play** button to listen the voice prompt as figure 8.4-3.

Figure 8.4-3

 **Save:**

Step 3: Click **Save** button to saving the voice file at local path, and the screen shows **Please input the file path and file name!!** (i.e. c:\irene_test.raw) as figure 8.4-4.

Figure 8.4-4

 **Save Remote File:**

Step 4: Click **Save Remote File** to saving the voice file at WellGate 5250, and the screen shows **“please input the file path and file name!!”** (i.e. 9999.raw) as figure 8.4-5

Figure 8.4-5

• Note: The file name must be “.raw” file format.

Open Remote File:

Step 5: Click Open Remote File button to open voice file at WellGate 5250 and screen shows Voice File List as figure 8.4-6.

File Name	Size	Date
123-1.raw	24KB	2002/02/25 1:19:19 PM
123.raw	24KB	2002/02/22 12:48:01 PM
9999.raw	32KB	2002/03/01 3:57:08 AM
b.raw	40KB	2002/02/05 6:34:57 PM
c.raw	40KB	2002/02/05 6:34:57 PM
ccc.raw	32KB	2002/02/25 1:30:08 PM
d.raw	149KB	2002/02/06 6:57:15 PM
e.raw	336KB	2002/02/06 7:30:42 PM
mail.raw	11KB	2002/02/25 11:05:50 AM

Apply Cancel

Figure 8.4-6

Open:

Step 6: Click Open button to open local host voice file and screen shows Choose File as figure 8.4-7.

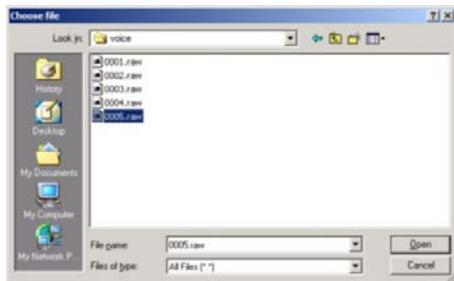

Figure 8.4-7

Close:

Step 7: Click Close button to close the voice file as figure 8.4-8.

Figure 8.4-8

 **Copy:**

Step 8: Select the desired voice range and click **Copy** button as figure 8.4-9

8.4-9

 **Paste:**

Step 9: Click **Paste** button to paste the voice range as figure 8.4-10.

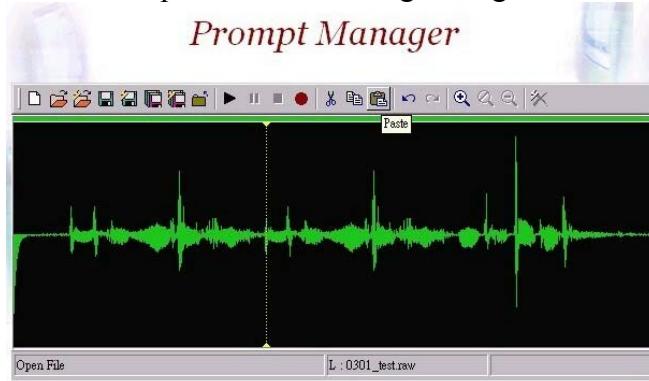

Figure 8.4-10

 **Cut:**

Step 10: Select the desired voice range and click **Cut** button as figure 8.4-11.

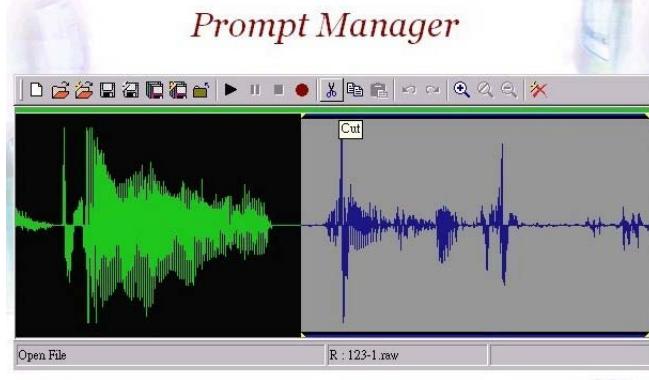

Figure 8.4-11

 **Save As:** Refer the Section "[Save](#)"

 **Save Remote As:** Refer the Section "[Save Remote File](#)"

 **Undo:**

Step 13: Click **Undo** button to return modification, you can see the configuration that haven't be changed as figure 8.4-12.

Figure 8.4-12

 **Redo: Refer Section “Undo”**

   **Zoom Zoom In Zoom Out:**

Step 14: Select the desired voice range click **Zoom** button as figure 8.4-13.

Figure 8.4-13

Step 15: The screen shows the zoom out voice file range as figure 8.4-14.

Figure 8.4-14

Delete Remote file:
Step 16: Click **Delete Remote file** button to delete remote voice file as figure 8.4-15.

Figure 8.4-15

Call Flow Editor

Please refer section "[Call Flow Editor](#)"

Account Manager

Please refer section "[Account Manager](#)"

Upgrade

Step 1: Click "Control→Upgrade" to upgrade the software as figure 7.5-1.

Figure 7.5-1

Field Description:

- File Name: Upload the software file name
- Upload: Remote Upload the software at WellGate 5250
- Apply: Remote apply the upload at WellGate 5250

Relogin

Please refer section "[Relogin](#)"

Chapter 9 System Monitor

It provides a way to monitor the system status.

Line Summary Status

Show channel summary status.

Start Path: Monitor→Line Summary Status

Line Summary Status			
Line ID	Talk Time	Successful Calls	Unsuccessful Calls
0-0-0	173	3	0
0-0-1	172	3	0

Debug Info

Start Path: Click “Monitor→Debug Info”

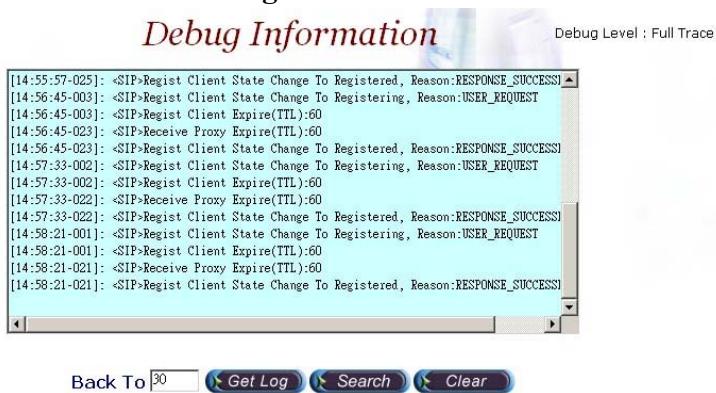

Figure 9.5-1

Filed Description:

- Get Log: Get debug log (-1~999)
- Search: Search debug logs
- Clear: Clear log

Ping

You can use the “Ping” to check an IP is active or not.

Start Path: Configuration→Ping

Figure 9.6-1

Field Description:

- Host IP Address: The IP address to ping

Chat 10 Telnet & RS-232 Configuration

WellGate 5250 also can support to be managed by Telnet or Console port (RS-232) for basic operations.

Interface:

- ❖ Network: TCP/IP Telnet
- ❖ RS232:
 - Connect using: COM1
 - Baud Rate: 9600
 - Data bits: 8
 - Parity: None
 - Stop bits: 1
 - Flow Control: None
 - Wire: Null modem line (crossed)

Logon WellGate 5250 by Telnet

Use Windows build-in Hyper Terminal or other telnet terminal emulator to login (e.g. telnet 192.168.111.111:10086). User ID & password will be required for login (default login user id: admin, password: admin & user id: root, password: root).

Command List:

Command	Description
echo	Auto echo on or off
eventlog	Clean or show system log message
exit	Quit the current session
ipconfig	Configure or show network information
ping	Check an IP address is available or not
reboot	Reboot
reset	Soft-reset
shutdown	Shutdown
time	Reset or show system time.
timezone	Setup or show system timezone
useradmin	Manage user account.
help & ?	View command list

Echo: auto echo on or not

Command	Purpose
[root#]echo ?	Usage: echo on/off Example: echo on
[root#]echo on	Echo is on
[root#]echo off	Echo is off (default value)

Eventlog: show system log message

Command	Purpose
[root#]eventlog ?	Usage: eventlog [-clear] Example: eventlog eventlog -clear
[root#]eventlog	<p>Show system eventlog:</p> <p>Eventlog example:</p> <p>Time: 2003-06-19 20:15:17 Event ID: 8700 Type: Warning Source : wellgate5x00 Description: [0]: evt: TRUNK ALARM: TrunkId=3</p> <p>Time: 2003-06-19 20:15:17 Event ID: 8700 Type: Warning Source : wellgate5x00 Description: [0]: evt: TRUNK ALARM: TrunkId=2</p> <p>Time: 2003-06-19 20:15:14 Event ID: 9501 Type: Information Source : wellgate5x00 Description: [0]: evt: BOARD STARTED: SLOT:8</p> <p><i>Press any key to continue or press 'Q' to quit</i></p>
[root#]eventlog -clear	Clear all event log

Exit: Quit the current session

Command	Purpose
[root#]exit	Quit the current session

Ipconfig: Configuration or show network information

Command	Purpose
[root#] ipconfig ?	Usage: ipconfig [-delete dns] [-dhcp] [-dns IPAddress1 IPAddress2] [-ip IPAddress -mask Mask -gateway Gateway] Example : ipconfig -ip 192.168.111.111 -mask 255.255.0.0 - gateway 192.168.1.254 : ipconfig -dhcp : ipconfig -dns 192.168.1.1 : ipconfig -delete dns
[root#]ipconfig	<p>Show current network configuration</p> <p>USE FIXED IP (or DHCP)</p> <p>IP Address : 192.168.5.113 Subnet Mask : 255.255.0.0 Default Gateway : 192.168.1.254 DNS Servers : 192.168.5.1 168.95.1.1</p>
[root#]ipconfig –delete dns	<p>Delete the DNS servers setting</p> <p>USE FIXED IP</p> <p>IP Address : 192.168.5.113 Subnet Mask : 255.255.0.0 Default Gateway : 192.168.1.254 DNS Servers :</p>
[root#]ipconfig –dhcp	<p>Enable DHCP</p> <p>USE DHCP</p> <p>IP Address : 192.168.5.10 Subnet Mask : 255.255.0.0 Default Gateway : 192.168.1.254</p>

	DNS Servers : 192.168.5.1 168.95.1.1
[root#]ipconfig -ip 61.220.126.28 -mask 255.255.0.224 -gateway 61.220.126.1	Use fixed network configuration USE FIXED IP IP Address : 61.220.126.28 Subnet Mask : 255.255.255.1 Default Gateway : 61.220.126.254 DNS Servers :
[root#]ipconfig -ip 61.220.126.115	Changes IP address only. USE FIXED IP IP Address : 61.220.126.115 Subnet Mask : 255.255.255.1 Default Gateway : 61.220.126.254 DNS Servers :
[root#]ipconfig -dns 210.59.126.53	Changes DNS configuration only. USE FIXED IP IP Address : 61.220.126.115 Subnet Mask : 255.255.255.1 Default Gateway : 61.220.126.254 DNS Servers : 210.59.126.53

Ping: Check an IP address is available or not

Command	Purpose
[root#] ping ?	Usage: ping IP. Example: ping 127.0.0.1
[root#]ping 61.220.126.1	Ping result Reply from 61.220.126.1 bytes=64 time=1ms TTL=29 Reply from 61.220.126.1 bytes=64 time=1ms TTL=29 Reply from 61.220.126.1 bytes=64 time=1ms TTL=29 Reply from 61.220.126.1 bytes=64 time=1ms TTL=29

Reboot:

Command	Purpose
[root#] reboot ?	Reboot System Are You Sure? (Y/N)
[root#]reboot Are You Sure?(Y/N)y	WellGate 5250 are rebooting

Shutdown:

Command	Purpose
[root#] shutdown ?	Shutdown System Are You Sure? (Y/N)
[root#]shutdown Are You Sure?(Y/N)y	WellGate 5250 are shutting down

Reset:

Command	Purpose
[root#] reset ?	Soft reset System Are You Sure? (Y/N)
[root#]reset Are You Sure?(Y/N)y	

Time: Reset or show system time

Command	Purpose
[root#] time ?	Usage : time YYYY-MM-DD HH:NN:SS Example : Time 2002-01-01 12:00:00
[root#]time	Show current time The current time is 2003-06-20 15:17:30
[root#]time 2003-07-29 23:14:53	Change system bios time

Timezone: Setup or show system timezone

Command	Purpose
[root#] timezone ?	<p>Fixed Zone List:</p> <p>01. Afghanistan Standard Time 03. Arab Standard Time 05. Arabic Standard Time 07. AUS Central Standard Time 09. Azores Standard Time 11. Please refer [Timezone to Country Mapping List](#)

Useradmin: Manager user account

Command	Purpose
[root#] useradmin ?	Usage: useradmin [-add User] [-delete User] [-password User] Example: useradmin -add irene
[root#]useradmin	Show the current login user account root
[root#]useradmin -list	Show the current user account list rdmin root irene
[root#] useradmin -add irene Password : irene	Add the new user account: irene

Confirm : irene Add user Success.	
[root#] useradmin -delete 1111 Are You Sure?(Y/N)y	<i>Delete the user: 1111</i>
[root#] useradmin -password root New Password : 1234 Confirm : 1234	<i>Change the user: root's password.</i>

Chat 11 LCD Display Configuration

WellGate 5250 provides a front panel LCD for basic operations.

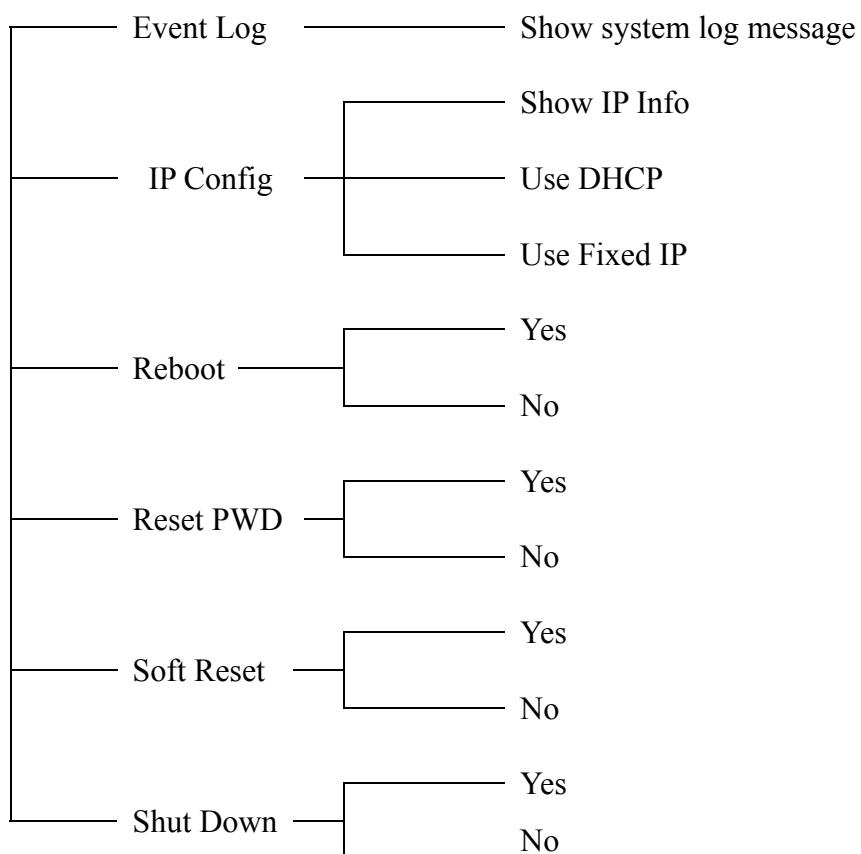

Button List:

Button List	Description
	When the WellGate 5250 is ready, the LCD screen shows as blow 
Enter	Press Enter to select command 
ESC	Quit the current command
▲	Up or previous edit mode
▼	Next or previous edit mode

Command Tree:

Main Menu

Event Log:

Configure	LCD Display
▲	Previous event log
▼	Next event log
Enter	Show detail event log
▲	Previous line
▼	Next line
ESC	Quit detail event log viewing
ESC	Quit to main menu

IP Config:

Configure	LCD Display
▲	Select Network configuration
▼	Select Network configuration
Enter	Configure Network
▲	Increase the digit apply to network setting
▼	Decrease the digit apply to network setting
Enter	Apply change to network information
ESC	Quit network setting
ESC	Quit to main menu

Reboot:

Configure	LCD Display
▲	Select Reboot or not
▼	Select Reboot or not
Enter	Reset user: root's (or admin) user password
ESC	Quit Reboot configure
ESC	Quit to main menu

Reset:

Configure	LCD Display
▲	Select user to change password
▼	Select user to change password
Enter	Change user password
▲	Increase the alphabet apply to user password setting
▼	Decrease the alphabet apply to user password setting
ESC	Quit Reset configure
ESC	Quit to main menu

Soft Reset:

Configure	LCD Display
▲	Select Reset or not
▼	Select Reset or not

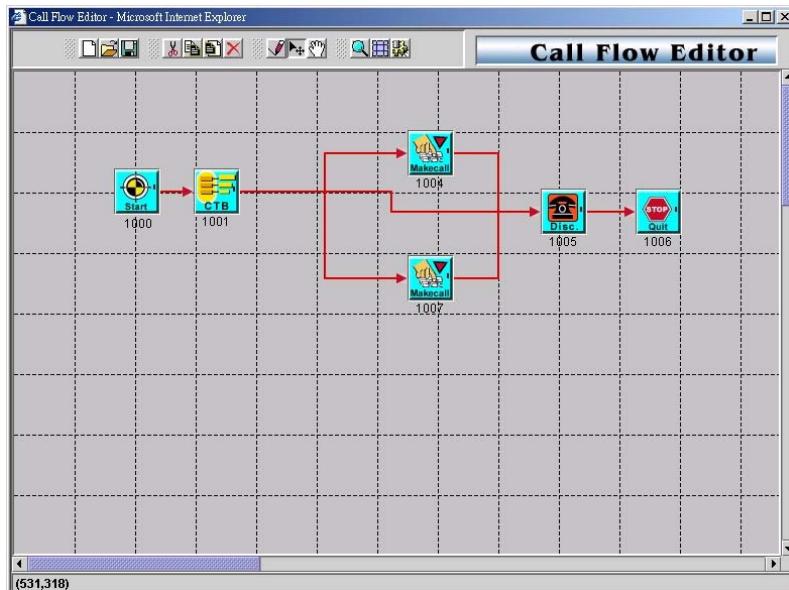

Enter	Reset or not
ESC	Quit Reset configure
ESC	Quit to main menu

Shutdown:

Configure	LCD Display
▲	Select Shutdown or not
▼	Select Shutdown or not
Enter	Shutdown or not
ESC	Quit Shutdown configure
ESC	Quit to main menu

Appendix 1 Call Flow Example

One Stage Dialing (Gatekeeper Mode)

Example Description:

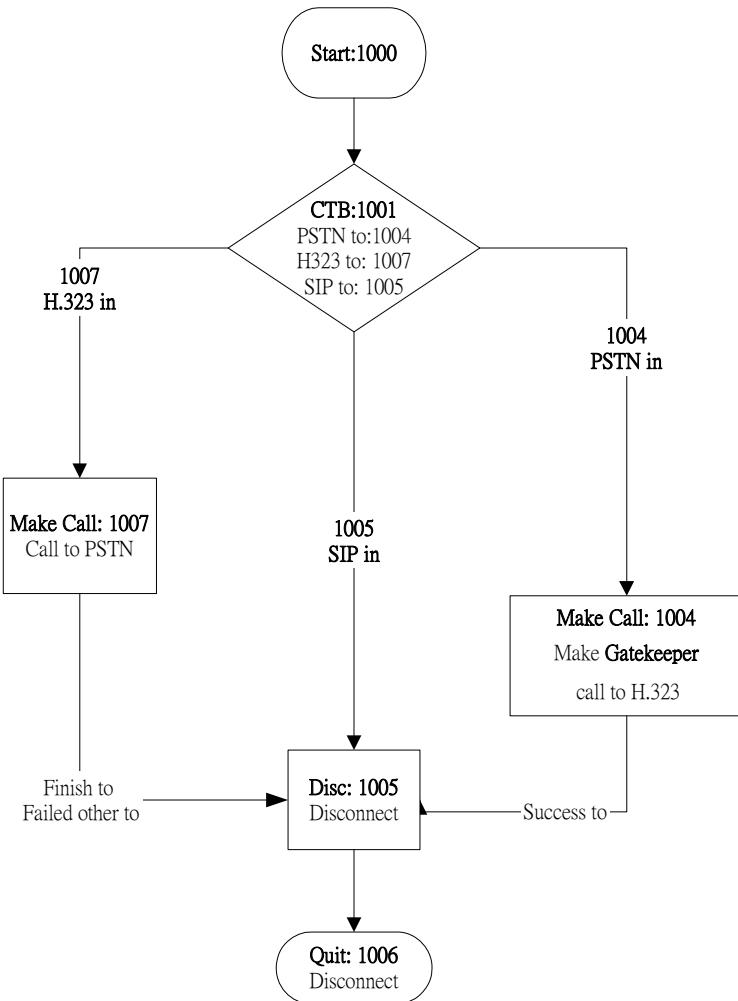

Components	Contents
 Start Component ID: 1000	Next Component: 1001
 CTB Component ID: 1001	PSTN To: 1004 H.323 To: 1007 SIP To: 1005

1007 Route for H.323 Gatekeeper call

 MakeCall Component ID: 1007	Route Mode: PSTN Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Reason: PSTN normal call clear Next Component: 1006
 Quit Component: 1006	

1004 Route for PSTN call

 MakeCall Component ID: 1004	Route Mode: Gatekeeper Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Next Component: 1006
 Quit Component: 1006	

Example Used Call Flow:

One Stage Dialing (SIP Proxy Mode)

Example Description:

Components	Contents
 Start Component ID: 1000	Next Component: 1001
 CTB Component ID: 1001	PSTN To: 1004 H.323 To: 1005 SIP To: 1007

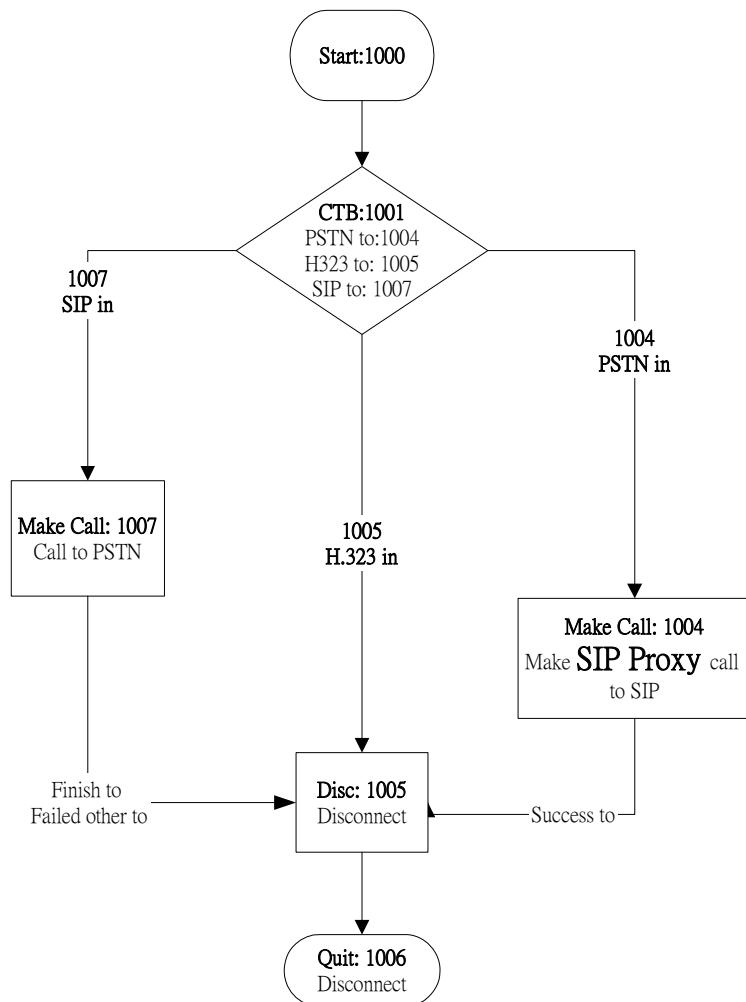

1007 Route for SIP Proxy call

 MakeCall Component ID: 1007	Route Mode: PSTN Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Reason: PSTN normal call clear Next Component: 1006
 Quit Component ID: 1006	

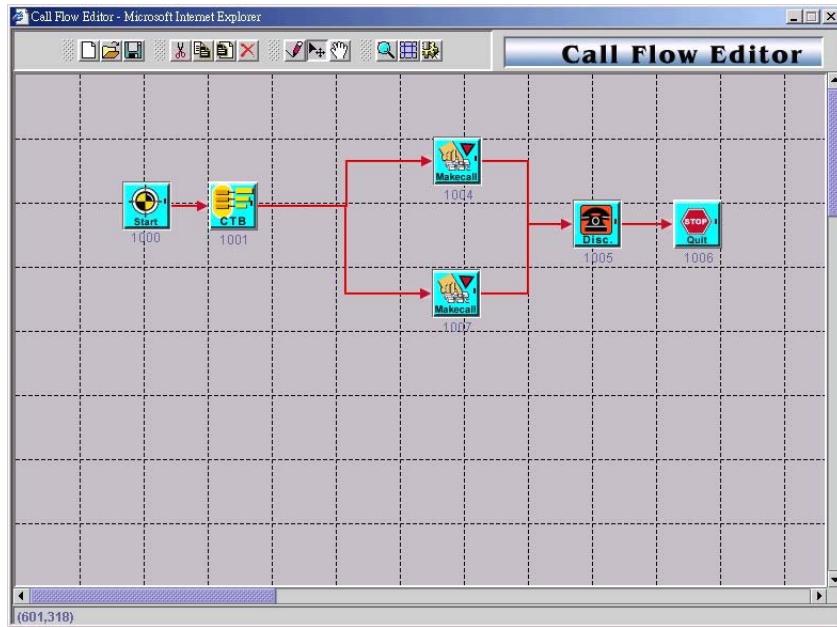

1004 Route for PSTN call

 MakeCall	Route Mode: SIP Proxy Call Finish To: 1005 Failed Other To: 1005
Component ID: 1004	
 Disconnect	Next Component: 1006
Component ID: 1005	
 Quit	
Component ID: 1006	

Example Used Call Flow:

One Stage Dialing (Peer to Peer Mode)

Example Description:

Components	Contents
 Start Component ID: 1000	Next Component: 1001
 CTB Component ID: 1001	PSTN To: 1004 H.323 To: 1007 SIP To: 1007

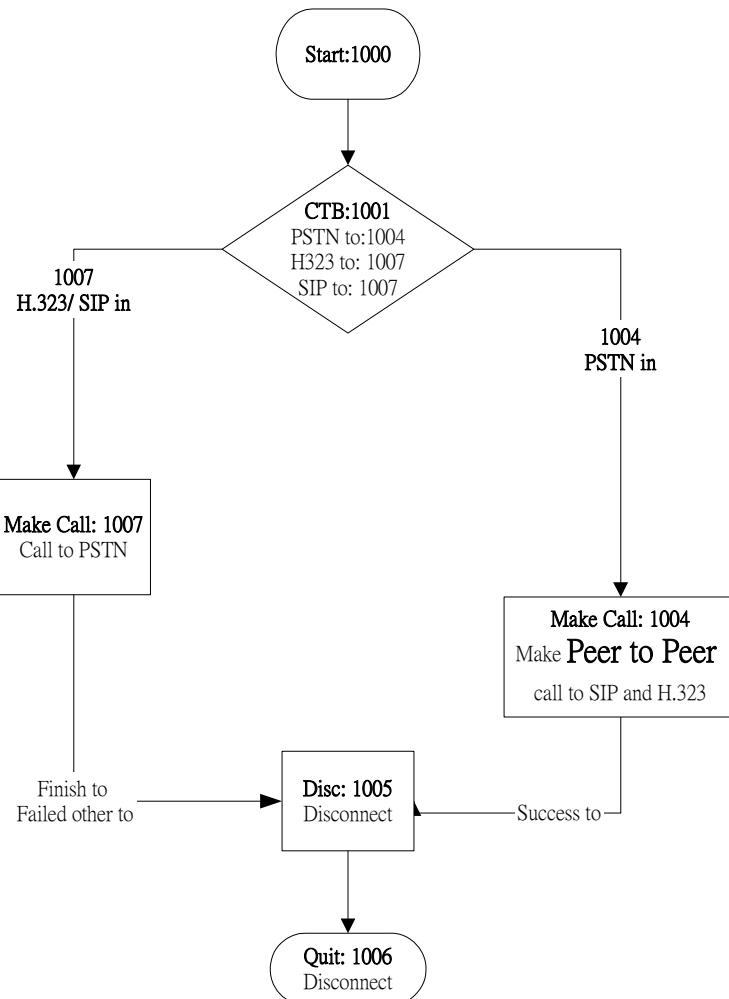

1007 Route for SIP Proxy or H.323 Gatekeeper call

 MakeCall Component ID: 1007	Route Mode: PSTN Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Next Component: 1006
 Quit Component ID: 1006	

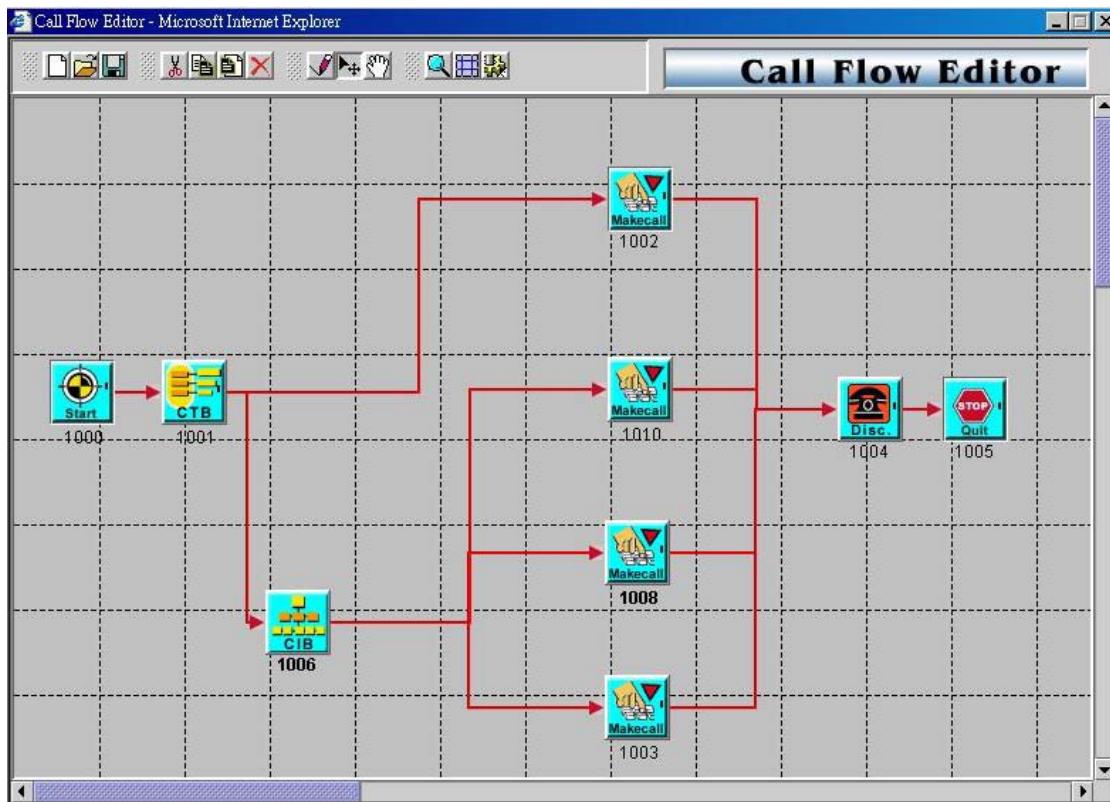

1004 Route for PSTN call

 MakeCall Component ID: 1004	Route Mode: P2P Call Finish To: 1005 Failed Other To: 1005
 Disc Component ID: 1005	Next Component: 1006
 Quit Component ID: 1006	

Example Used Call Flow:

Two Stage Dialing (VoIP, PSTN mixed call)

Example Description:

Components	Contents
Call route from PSTN to IP Side	
 Start Component ID: 1000	Next Component: 1001
 CTB Component ID: 1001	PSTN To: 1002 H.323 To: 1006 SIP To: 1006

1001 route for SIP Proxy and H.323 Gatekeeper call

 CIB Component ID: 1006	Info Type: DNIS Prefix: 5 goto: 1010 Prefix: 7 goto: 1008 Other goto: 1003
 MakeCall Component ID: 1010	Route Mode: Gatekeeper Call Finish To: 1004 Failed Other To: 1004
 MakeCall	Route Mode: SIP Proxy Call Finish To: 1004 Failed Other To: 1004

Component ID: 1008	
 MakeCall	Route Mode: PSTN Finish To: 1004 Failed Other To: 1004
Component ID: 1003	
 Disc	Next Component: 1005
Component ID: 1004	
 Quit	
Component ID: 1005	

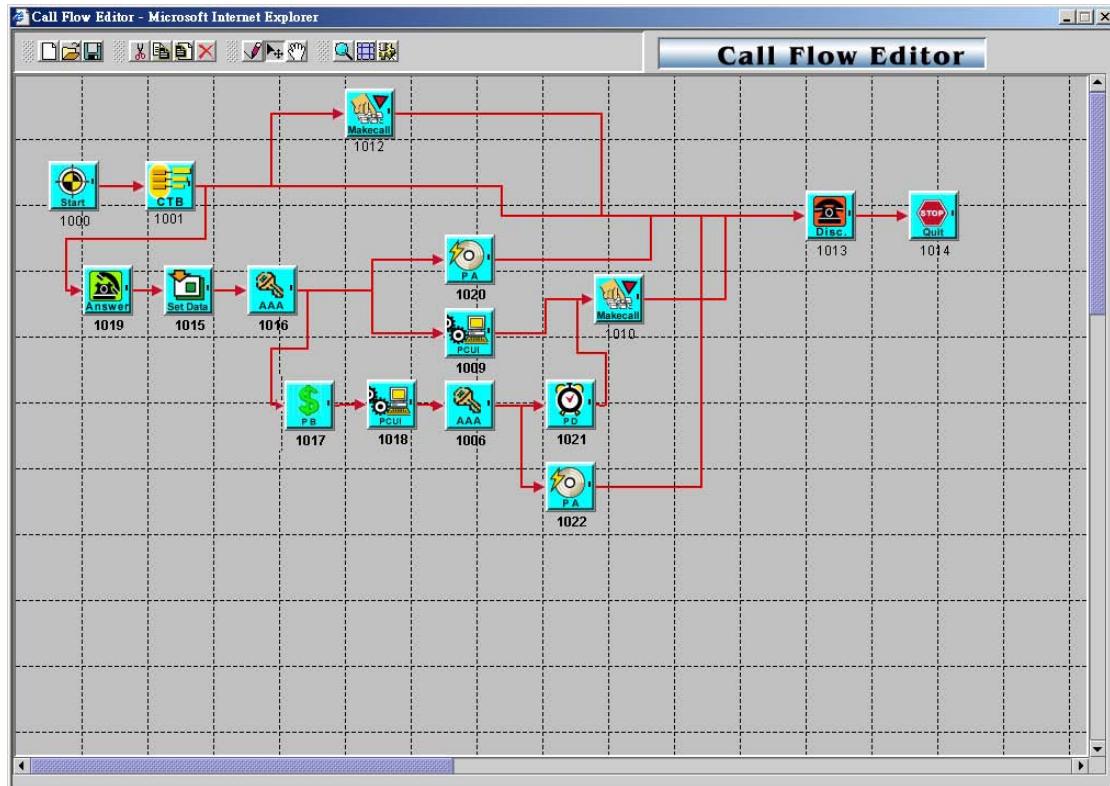

1001 Route for PSTN call

 MakeCall	Route Mode: SIP Proxy Call Finish To: 1004 Failed Other To: 1004
Component ID: 1002	
 Disc	Next Component: 1005
Component ID: 1004	
 Quit	
Component ID: 1005	

Example Used Call Flow:

Two Stage Dialing with AAA (IP Side AAA)

Example Description:

Components	Contents
Start Component ID: 1000	Next Component: 1001
CTB Component ID: 1001	PSTN To: 1012 H.323 To: 1013 SIP To: 1019

1012 Route for PSTN call

MakeCall Component ID: 1012	Route Mode: SIP Proxy Finish To: 1013 Failed Other To: 1013
Disc Component ID: 1013	Next Component: 1014
Quit Component ID: 1014	

1012 Route for H.323 call

 Disc	Next Component: 1014
Component ID: 1013	
 Quit	
Component ID: 1014	

1012 Route for SIP call

 Answer	Next Component: 1015

 Quit Component ID: 1014	

Example Used Call Flow:

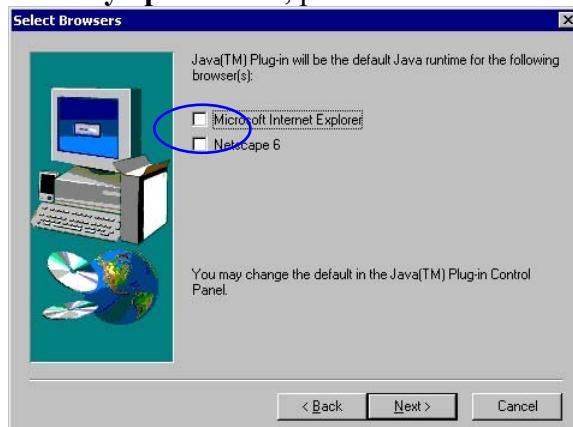

Appendix 2 Java plug-in Installation

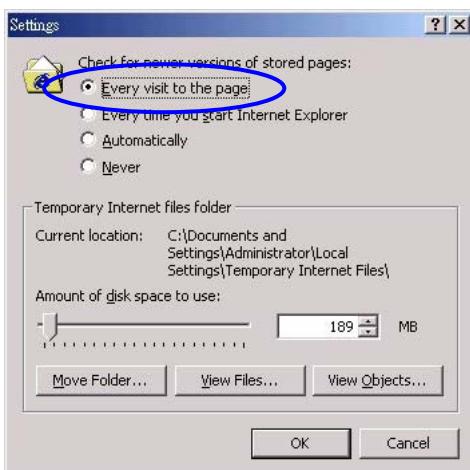

You need to install Java Plug-in before using call flow editor, prompt manager and upgrade. Please confirm you JRE version is 1.4.1_02 or above if your PC has already installed Java.

After downloaded the java runtime version (1.3.1 or later) from Sun, you just follow the wizard to install the Java runtime. When you see the display shows “Select Browsers”, **do not select any option item**, press **Next** button to continue.

You also need to set newer versions of stored pages. **Click Tool→Internet Option →General→Setting.**

After success, restart your browser to take effect.

Appendix 3 Retrieve CDR Information

☺ Retrieve method example (stop20040305.log) by ftp:

```
C:>ftp 192.168.19.117
Connected to 192.168.19.117.

Appendix 9 RADIUS Format Attributes

Welltech RADIUS Format V2.0

Vender ID: 9

Start Accounting Request Attributes

Attribute	Name	Description	Format	Sample
4	NAS-IP-Address	IP Address of the In-Bound gateway	Numeric	4 bytes unsigned long
61	NAS-Port-Type	Physical port type	Numeric	0: Asynchronous
1	User-Name	Account number(with 4 digit pin number on postfix)	String	5500033440
31	Calling-Station-Id	Calling Party Number (ANI)	String	886282265699
30	Called-Station-Id	Destination phone number	String	86258765432
40	Acct-Status-Type	Accounting Request Type	Numeric	1: Start Accounting 2: Stop Accounting
6	Service-Type	Type of service requested	Numeric	5: Outbound
26	h323-gw-id -33	Name of the Gateway (IP address)	String	h323-gw-id =WG5200
26	h323-conf-id -24	GUID	String	h323-conf-id=xxxx
26	h323-call-type -27	Protocol type or family used on this leg of the call (Telephony or VOIP)	String	h323-call-type=VOIP
26	h323-call-origin - 26	'Originate' or 'Answer'	String	h323-call-origin =Originate
26	h323-setup-time -25	Setup time in NTP format	String	h323-setup-time= 23:24:19.810 UTC Sun Sep 26 2001
44	Acct-Session-Id	A unique accounting identifier - match start & stop	String	8 bytes, like 00012345
41	Acct-Delay-Time	No of seconds tried in sending a particular record	Numeric	5

Stop Accounting Request Attributes

Attribute	NAME	Description	Format	Sample
4	NAS-IP-Address	IP Address of the In-Bound gateway	Numeric	4 bytes unsigned long
61	NAS-Port-Type	Physical port type	Numeric	0: Asynchronous
1	User-Name	Account number (with 4 digit pin number on postfix)	String	5500033440
30	Called-Station-Id	Destination phone number	String	862587654321
31	Calling-Station-Id	Calling Party Number (ANI)	String	886282265699
40	Acct-Status-Type	Account Request Type	Numeric	1: Start Accounting 2: Stop Accounting
6	Service-Type	Type of service requested	Numeric	5: Outbound
26	h323-gw-id -33	Gateway IP address	String	h323-gw-id =WG5200
26	h323-conf-id -24	GUID	String	h323-conf-id =xxxx
26	h323-call-type -27	Protocol type used on this leg of the call - Telephony or VOIP	String	h323-call-type=VOIP
26	h323-setup-time -25	Setup time in NTP format	String	h323-setup-time=23:24:19.810 UTC Sun Sep 26 2001
26	h323-connect-time -28	Connect time in NTP format	String	h323-connect-time=23:24:19.810 UTC Sun Sep 26 2001
26	h323-disconnect-time -29	Disconnect time in NTP format	String	h323-disconnect-time=23:24:19.810 UTC Sun Sep 26 2001
26	h323-disconnect-cause -30	Q.931 disconnect cause code	String	h323-disconnect-cause=16
26	h323-call-origin - 26	'Originate' or 'Answer'	String	h323-call-origin =Originate
26	h323-remote-address-23	IP address of the Out-Bound gateway	String	h323-remote-address=192.168.19.150
44	Acct-Session-Id	A unique accounting identifier-match start & stop	String	8 bytes, like 00012345
46	Acct-Session-Time	For how many second the user receive the service	Numeric	
41	Acct-Delay-Time	No of seconds tried in sending a particular record	Numeric	5

Authentication Request Attributes

Attribute	NAME	Description	Format	Sample
4	NAS-IP-Address	IP Address of the In-Bound gateway	Numeric	4 bytes unsigned long
61	NAS-Port-Type	Physical port type	Numeric	0: Asynchronous
6	Service-Type	Type of service requested	Numeric	8: Authentication Only
1	User-Name	Account number (with 4 digit pin number on postfix)	String	5500033440
31	Calling-Station-Id	Calling Party Number (ANI)	String	886282265699
26	h323-conf-id - 24	GUID	String	h323-conf-id=xxx
2	User-Password	16 octets user password	String	

Authentication Response Attribute

Attribute	NAME	Description	Format	Sample
26	h323-return-code -103	The reason for failing authentication	String	h323-return-code=0 0: Authenticated 1: Invalid Account 2: Invalid pin number 3: Account in use 5: Account Expired 6: Over Credit Limit 7: Denied User 10: Number of Retries Exceeded 11: Insufficient Balance
26	h323-credit-amount -101	Amount of credit (currency) remaining in the account	String	h323-credit-amount=13.25
26	h323-billing-model -109	Type of billing service for a specific call.	String	h323-billing-model=1 0:Credit (Post Paid) 1:Debit (Prepaid)
26	h323-currency-type -110	Currency for use with h323-credit-amount	String	h323-currency-type=USD ISO 4217 USD America, Dollars EUR Euro GBP U.K., Pounds

Authorization Request Attributes

Attribute	NAME	Description	Format	Sample
4	NAS-IP-Address	IP Address of the In-Bound gateway	Numeric	4 bytes unsigned long
61	NAS-Port-Type	Physical port type	Numeric	0: Asynchronous
6	Service-Type	Type of service requested	Numeric	5: Outbound
1	User-Name	Account number (with 4 digit pin number on postfix)	String	5500033440
30	Called-Station-Id	Destination phone number	String	862587654321
31	Calling-Station-Id	Calling Party Number (ANI)	String	886282265699
26	h323-conf-id - 24	GUID	String	h323-conf-id=xxxx
2	User-Password	16 octets user password	String	

Authorization Response Attributes

Attribute	NAME	Description	Format	Sample
26	h323-return-code -103	The reason for failing authentication	String	h323-return-code=0 0: Authenticated 1: Invalid Account 2: Invalid pin number 3: Account in use 4: Zero Balance 5: Account Expired 6: Over Credit Limit 7: Denied User 9: Called Number Blocked 10: Number of Retries Exceeded 11: Insufficient Balance
26	h323-credit-time - 102	Number of seconds for which the call is authorized	String	h323-credit-time=360

Appendix 10 Quick Start Check List

Host Network:

IP Address: _____
Sub-Mask: _____
Default-Gateway: _____

Interface Network:

IP Address: _____
Sub-Mask: _____
Default-Gateway: _____

► H.323 Call:

VoIP Configuration:

- | | |
|---|---|
| <input type="checkbox"/> Register to Gatekeeper
GK IP Address: _____
GK RAS Port: _____ | <input type="checkbox"/> Peer To Peer
Refer to User Guide-Phone Book setting |
|---|---|

H.245 tunneling: Enable Disable

Fast Connect: Enable Fast Start Early H.245 Disable

Separate H.245 after Fast Start: Yes No

Fast Start Enabled Codec:

- G.711 a-law
- G.711 u-law
- G.729
- G.729 A/B
- G.723.1 (5.3K)
- G.723.1 (6.3A)

Codec Select Priority:

- ____ G.711 a-law
- ____ G.711 u-law
- ____ G.729
- ____ G.729 A/B
- ____ G.723.1 (5.3K)
- ____ G.723.1 (6.3A)

► SIP Call:

VoIP Configuration: Peer To Peer

- | | |
|--|--|
| <input type="checkbox"/> Register to SIP Proxy Server
Registrar Proxy Server: _____
Registrar Proxy Port: _____
Registrar User ID: _____
Registrar Password: _____
Outbound Proxy Server: _____
Outbound Proxy Port: _____
Outbound User: _____
Outbound Port: _____ | Refer to User Guide-Phone Book setting |
|--|--|

180 SDP: Yes No

183 SDP: Yes No

Local Codec Codec:

- G.711 a-law
- G.711 u-law
- G.729
- None
- G.723.1 (5.3K)
- G.723.1 (6.3A)

Accept Proxy Call Only: Yes No

PSTN Interface:

WellGate 5250 FAQ

Q1. Forgotten user password to logon WellGate 5250.

Answer:

- a. Logon by a user has Administrator right to reset the user's password
- b. If there is no any users can logon, use the following user/password for emergency recovery:
User: Serial no (from license card)
Password: first 8 characters of "License Key" (from license card)
- c. Use the LCD control panel to change the user id: admin or root's password.

Q2. In H.323 Mode: Cannot hear ring back tone for PSTN caller.

Answer:

Normally, the ring back tone is generated by the nearest PABX connected to WG5250. If a caller from PSTN site cannot hear the ring back tone, please check:

- a. Consult to PABX/PSTN vendor to clarify the PABX/PSTN will generate ring back tone.
- b. For Fast Start mode, make sure the far end VoIP end point will have ring tone generated. For example, a PSTN subscriber calls a VoIP H.323 Lan- Phone. When it is on Fast Start mode, WG5250 will cut through the voice path after receive Fast Start Ack. Please make sure the Far End VoIP Endpoint will generate ring back tone over RTP media path to WG5250.
- c. If you really need WG5250 to generate PSNT ring back tone, please do the following setting:
 - Turn on "local ring back" from "Interface -> Trunk" for each trunk required local ring back tone generation.
 - Disable Fast Start for H.323 outgoing call (set to disable or H.323 incoming call only.)

Q3. In H.323 Mode: WG5250 cannot keep registering to Gatekeeper after Gatekeeper restarted.

Answer:

- a. Check whether WG5200's register time to live is too long or not. If yes, make it shorter from "H.323 -> Register Time to Live". If we make it longer, it means it might need take long time to re-register to Gatekeeper after Gatekeeper failed or restart. If it is very short, will cause more IP traffic.
- b. Check whether Gatekeeper has a preset TTL setup or not. If so, the GK TTL will overwrite the WG5250's TTL request by using the default value.

Q4. In SIP Mode: WG5250 cannot keep registering to SIP Register Server after Register Server restarted.

Answer:

- a. Check whether WG5250's registrar IP address, port, user id and password are correct.
- b. Check whether Register Server has a preset TTL setup or not. If so, the Register Server TTL will overwrite the WG5250's TTL request by using the default value.

Q5. WG5250 cannot make a success call.

Answer:

- a. Check PSTN trunk ready to work or not. You need to have the following event generated - “9504: trunk alarm clear (trunk #)”
- b. Check WG5250 is registered to H.323: Gatekeeper /SIP: Register Server or not. You need to have the following event generated - “9503: H323 GK/ SIP Register [xxx.xxx.xxx.xxx] found & registered”
- c. Check the digit manipulation setting is correct or not. Make sure you have DM put into call flow editor, interface or VoIP.
- d. For P2P call, make sure you have the address book setting for dialed number.

Q6. Cannot hear voice after the calls connect.

Answer:

- a. Make sure the interface and host Enternet are well connected.
- b. Ping each related IP to see network is working or not.
- c. The voice codec priority should be matched both side.

Q7. In H.323 Mode: Failed to setup a fast start call.

Answer:

- a. Make sure the far end “Fast Start” is enabled.
- b. Check weather Gatekeeper can support Fast Start or not. (Some Gatekeeper are not.)
- c. If you cannot hear early announcement, make sure the far and H.323 end point can listen RTP port before connect.

Q8. In SIP Mode: Failed to setup a normal call.

Answer:

- a. Make sure the voice codec priority should be matched both side.
- b. Make sure the WG5250 is accept proxy call only or not.

Q9. In SIP Mode: Failed to hear the early media before call connected.

Answer:

- a. Make sure the 180 SDP or 183 SDP are enabled.
- b. Make sure the remote SIP end point can cut through voice before call connected.

Q10. Cannot send or receive the DTMF to/from far end VoIP end point.

Answer:

- a. *In H.323 Mode:* Make sure WG5250 and other endpoint use same DTMF relay mode (e.g. H.245 Alphanumeric.)
- b. *In SIP Mode:* Make sure WG5250 and other endpoint use same DTMF relay mode (e.g. SIP Info or RFC2833-payload type.)
- c. *In SIP Mode:* Make sure the remote SIP end point’s RTP payload type is supported or not.
- d. If use Q.931 UUI DTMF Relay mode, make sure Gatekeeper can correctly forward Q.931 UUI when registering to Gatekeeper is set to true.

Q8. Does WG5250 can cooperate with the Cisco VoIP products.

Answer:

The short answer is “yes”. The following configuration example can be used for normal and fax call.

Example for H.323 Mode

```
voice service voip  
fax protocol t38 ls-redundancy 1 hs-redundancy 1
```

```
voice class codec 100  
codec preference 1 g723r63  
codec preference 2 g729r8  
codec preference 3 g711ulaw  
codec preference 4 g711alaw
```

```
dial-peer voice 100 pots  
application session  
destination-pattern 8001  
progress_ind progress enable 8  
port 1/1/0
```

```
dial-peer voice 200 voip  
destination-pattern 2T  
voice-class codec 100  
session target ras  
dtmf-relay h245-signal h245-alphanumeric  
fax rate 14400  
fax-relay ecm disable  
fax protocol t38 ls-redundancy 1 hs-redundancy 1  
no vad
```

Example for SIP Mode

```
voice service voip  
fax protocol t38 ls-redundancy 1 hs-redundancy 1  
dial-peer voice 300 voip  
destination-pattern 20T  
rtp payload-type nte 110  
voice-class codec 88  
session protocol sipv2  
session target ipv4:192.168.5.205  
dtmf-relay rtp-nte  
fax-relay ecm disable  
fax rate 14400

Q9. WG5250 cannot register to Cisco gatekeeper.

Answer:

- a. Make sure GK IP and port number is correct.
- b. If the gatekeeper can only allow predefined endpoint, make sure WG5250 has it defined.
- c. If you need prefix support, set it on GK.

Q10. External Radius server does not work.

Answer:

- a. Make sure “VoIP Authentication method” is set to “ external AAA”.
- b. Make sure “AAA” component is used in the call flow editor to take effect.
- c. Make sure Radius server IP and port for authentication & billing are correct.

Q11. Internal Radius server does not work.

Answer:

- a. Make sure “VoIP Authentication method” is set to “ internal AAA”.
- b. Make sure “AAA” component is used in the call flow editor to take effect.
- c. Make sure only debit user is used for VoIP caller.

Q12. PSTN hunting Group does not work.

Answer:

- a. Make sure “PSTN hunting Group” component is used in the call flow editor to take effect.
- b. Make sure “prefix” is met your target dialed number.
